Welcome – Thanks for joining this ITRC Training Class

ITRC Internet-based training and Technical and Regulatory Guidance Integrated DNAPL Site Strategy

Sponsored by: Interstate Technology and Regulatory Council (<u>www.itrcweb.org</u>) Hosted by: US EPA Clean Up Information Network (www.cluin.org)

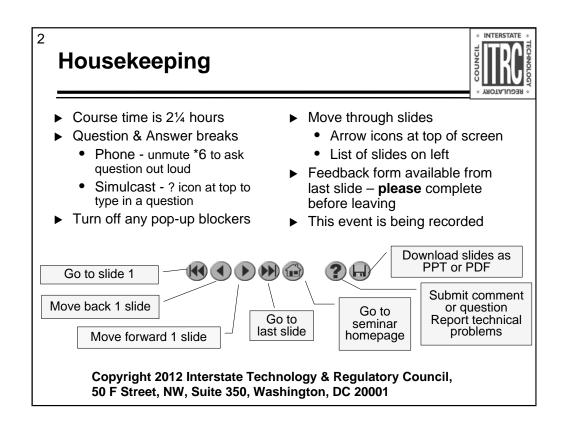

Sites contaminated by chlorinated solvents present a daunting environmental challenge, especially at sites with dense nonaqueous phase liquid (DNAPL) still present. Restoring sites contaminated by chlorinated solvents to typical regulatory criteria (low parts-per-billion concentrations) within a generation (~20 years) has proven exceptionally difficult, although there have been successes. Site managers must recognize that complete restoration of many of these sites will require prolonged treatment and involve several remediation technologies. To make as much progress as possible requires a thorough understanding of the site, clear descriptions of achievable objectives, and use of more than one remedial technology. Making efficient progress will require an adaptive management approach, and may also require transitioning from one remedy to another as the optimum range of a technique is surpassed. Targeted monitoring should be used and re-evaluation should be done periodically.

This <u>ITRC Integrated DNAPL Site Strategy</u> (IDSS-1, 2011) technical and regulatory guidance document will assist site managers in development of an integrated site remedial strategy. This course highlights five important features of an IDSS including:

- 1. A conceptual site model (CSM) that is based on reliable characterization and an understanding of the subsurface conditions that control contaminant transport, reactivity, and distribution
- 2. Remedial objectives and performance metrics that are clear, concise, and measureable
- 3. Treatment technologies applied to optimize performance and take advantage of potential synergistic effects
- 4. Monitoring based on interim and final cleanup objectives, the selected treatment technology and approach, and remedial performance goals
- 5. Reevaluating the strategy repeatedly and even modifying the approach when objectives are not being met or when alternative methods offer similar or better outcomes at lower cost

This IDSS guidance and training is intended for regulators, remedial project managers, and remediation engineers responsible for sites contaminated by chlorinated solvents. Because the subject matter is complex, this guidance assumes a functional understanding of the field and is targeted towards experienced users; however, novices will benefit through descriptions and references of the latest evolution of site characterization challenges; realistic planning of site restoration; evolving treatment techniques; and evaluating, monitoring and interpreting mass transport in the subsurface aqueous and vapor phases. While the primary focus of the document is on DNAPL sites, other types of contaminated sites (e.g. petroleum, mixed contaminants, etc.) can use the same fundamental process described in this guidance.

ITRC (Interstate Technology and Regulatory Council) www.itrcweb.org
Training Co-Sponsored by: US EPA Technology Innovation and Field Services Division (TIFSD) (www.clu-in.org)
ITRC Training Program: training@itrcweb.org; Phone: 402-201-2419

Although I'm sure that some of you are familiar with these rules from previous CLU-IN events, let's run through them quickly for our new participants.

We have started the seminar with all phone lines muted to prevent background noise. Please keep your phone lines muted during the seminar to minimize disruption and background noise. During the question and answer break, press \*6 to unmute your lines to ask a question (note: \*6 to mute again). Also, please do NOT put this call on hold as this may bring unwanted background music over the lines and interrupt the seminar.

You should note that throughout the seminar, we will ask for your feedback. You do not need to wait for Q&A breaks to ask questions or provide comments using the? icon. To submit comments/questions and report technical problems, please use the? icon at the top of your screen. You can move forward/backward in the slides by using the single arrow buttons (left moves back 1 slide, right moves advances 1 slide). The double arrowed buttons will take you to 1st and last slides respectively. You may also advance to any slide using the numbered links that appear on the left side of your screen. The button with a house icon will take you back to main seminar page which displays our presentation overview, instructor bios, links to the slides and additional resources. Lastly, the button with a computer disc can be used to download and save today's presentation slides.

  - Technical and regulatory guidance documents
  - Internet-based and classroom training

The Interstate Technology and Regulatory Council (ITRC) is a state-led coalition of regulators, industry experts, citizen stakeholders, academia and federal partners that work to achieve regulatory acceptance of environmental technologies and innovative approaches. ITRC consists of all 50 states (and Puerto Rico and the District of Columbia) that work to break down barriers and reduce compliance costs, making it easier to use new technologies and helping states maximize resources. ITRC brings together a diverse mix of environmental experts and stakeholders from both the public and private sectors to broaden and deepen technical knowledge and advance the regulatory acceptance of environmental technologies. Together, we're building the environmental community's ability to expedite quality decision making while protecting human health and the environment. With our network of organizations and individuals throughout the environmental community, ITRC is a unique catalyst for dialogue between regulators and the regulated community.

For a state to be a member of ITRC their environmental agency must designate a State Point of Contact. To find out who your State POC is check out the "contacts" section at www.itrcweb.org. Also, click on "membership" to learn how you can become a member of an ITRC Technical Team.

ITRC Course Topics Planned for 2012 – More information at www.itrcweb.org

#### Popular courses from 2011

- Bioavailability Considerations for Contaminated Sediment Sites
- ► Biofuels: Release Prevention, Environmental Behavior, and Remediation
- Decision Framework for Applying Attenuation Processes to Metals and Radionuclides
- Development of Performance Specifications for Solidification/Stabilization
- LNAPL 1: An Improved Understanding of LNAPL Behavior in the Subsurface
- ► LNAPL 2: LNAPL Characterization and Recoverability Improved Analysis
- ► LNAPL 3: Evaluating LNAPL Remedial Technologies for Achieving Project Goals
- ► Mine Waste Treatment Technology Selection
- **▶** Phytotechnologies
- ▶ Permeable Reactive Barrier (PRB): Technology Update
- ▶ Project Risk Management for Site Remediation
- ▶ Use and Measurement of Mass Flux and Mass Discharge
- ▶ Use of Risk Assessment in Management of Contaminated Sites

#### New in 2012

- ► Green & Sustainable Remediation
- Incremental Sampling Methodology
- Integrated DNAPL Site Strategy

2-Day Classroom Training:

 Light Nonaqueous-Phase Liquids (LNAPLs): Science, Management, and Technology

October 16-17, 2012 in Novi, Michigan (Detroit Area)

More details and schedules are available from www.itrcweb.org.

Heather Rectanus Battelle Madison, WI 608-824-9191 rectanush@battelle.org

Aaron B. Cohen is a Project/Contract Manager at the Florida Department of Environmental Protection (FDEP) in Tallahassee, Florida. Aaron has worked with the Hazardous Waste Cleanup Section since 1998. He supervises and coordinates the cleanup of chlorinated solvent and hazardous waste sites within the Florida Drycleaning Solvent Cleanup Program, the State-funded Hazardous Waste Program, and Superfund. Prior to FDEP, Aaron worked for eight years in the environmental consulting field with ABB Environmental and Levine Fricke. Aaron has been active in the ITRC since 2008 when he joined the ITRC DNAPL Team. Aaron earned a bachelor's degree in History from Davidson College in Davidson, North Carolina in 1988.

Dr. Wilson S. Clayton is the Remediation Services Business Unit Manager at Trihydro Corporation located in their Evergreen, CO office. Wilson previously was the founder and President of Aquifer Solutions, Inc., which was acquired by Trihydro in May 2011. He has previously served as a corporate-level technology director at Groundwater Technology, Fluor Daniel GTI, and IT Corporation, where he managed research, development, and commercialization of in-situ remediation technologies. Wilson has a quarter-century of remediation experience spanning the full spectrum fermediation technologies. His doctoral research involved reactive and multiphase flow and transport considerations for in situ remediation. He has been a member of ITRC since 2001, and has worked with ITRC teams on chemical oxidation, LNAPLs, Bioremediation of DNAPLs, and Integrated DNAPL Site Strategy. Wilson earned a bachelor's degree in geology from Clemson University in Clemson, South Carolina in 1984, a master's degree in geology from University of Connecticut in Storrs, Connecticut in 1986, and a doctoral degree in geological engineering from Colorado School of Mines in Golden, Colorado in 1996. He is a professional engineer and a professional geologist in multiple states.

Alex MacDonald is a senior engineer in the technical support section of the Cleanup Unit at the Central Valley Regional Water Quality Control Board in Rancho Cordova, California. He has worked at the Water Quality Control Board since 1984. He primarily works on cleanup of the Aerojet site in Rancho Cordova, California and other nearby sites such as McClellan Air Force Base. Alex has also worked on cleanup at underground and above ground storage tanks sites; permitting and inspection of landfill and waste disposal to land sites; regulating application of biosolids sites; regulating NPDES sites that include wastewater treatment plants, power plants, industrial facilities, and groundwater treatment facilities; and permitting and inspecting dredging projects. Alex was a member of the ITRC Perchlorate team. Alex earned a bachelor's degree in Civil/Environmental Engineering from Stanford University in Palo Alto, California in 1977 and a master's degree in Civil/Environmental Engineering from Sacramento State University in Sacramento, California in 1987.

Dan Bryant, Ph.D., is Vice President and Senior Project Manager for Geo-Cleanse International, Inc. in Matawan, New Jersey. Dan has worked in the field of in-situ chemical and biological remediation methods since first joining Geo-Cleanse in 1997. Dan holds three patents related to biological and chemical in-situ treatment technologies of organic and inorganic contaminants in soil and groundwater. Dan is particularly involved in design and implementation of in-situ chemical oxidation projects in the U.S. and Europe. Dan has contributed to the ITRC since 2008 as a member of the Integrated DNAPL Site Strategies team. Dan earned bachelor's and master's degrees in geology from the University of Florida in Gainesville, Florida in 1988 and 1990, respectively, and a Ph.D. in geology from Columbia University in New York, in 1995.

Dr. Charles (Chuck) J. Newell is a Vice President of GSI Environmental Inc in Houston, Texas and has worked for GSI since 1989. His professional expertise includes site characterization, groundwater modeling, non-aqueous phase liquids, risk assessment, natural attenuation, bioremediation, non-point source studies, software development, and long-term monitoring projects. He is a member of the American Academy of Environmental Engineers, a NGWA Certified Ground Water Professional, and an Adjunct Professor at Rice University. He has co-authored five U.S. EPA publications, eight environmental decision support software systems, numerous technical articles, and two books: Natural Attenuation of Fuels and Chlorinated Solvents and Ground Water Contamination: Transport and Remediation. He has taught graduate level groundwater courses at both the University of Houston and Rice University. He has been awarded the Hanson Excellence of Presentation Award by the American Association of Petroleum Geologists, the Outstanding Presentation Award by the American Institute of Chemical Engineers, and the 2001 Wesley W. Horner Award by the American Society of Civil Engineers (for the paper, "Modeling Natural Attenuation of Fuels with BIOPLUME III"). He was recently cited as the Outstanding Engineering Alumni from Rice University in 2008. He earned a bachelor's degree in Chemical Engineering in 1978, a master's degree in Environmental Engineering in 1981, and a Ph.D. in Environmental Engineering in 1989, all from Rice University in Houston Texas.

Dr. Heather Rectanus is a Principal Research Scientist at Battelle in Madison, WI. She has worked in the Environmental Restoration and Infrastructure section of Battelle since 2007 where she manages environmental restoration projects and serves as the section's bioremediation technical specialist. Heather's interests reside in technology transfer to integrate the state of the science with field applications. To that end, she manages the remedial innovative technology seminar series for the Navy and has served as Co-chairs for the Tenth International In Situ and On-Site Bioremediation Symposium (May 2009) and the International Symposium on Bioremediation and Sustainable Environmental Technologies (June 2011). Additionally, Heather has worked on projects ranging from biobarrier installation, biosparging designs, MNA utilization, DNAPL remediation strategies. Prior to joining Battelle, she was a post-doctoral researcher in the Charles E. Via Civil and Environmental Engineering Department at Virginia Tech where she investigated the impact of nanoparticle size on Raman spectroscopy and instructed the Introduction to Fluid Mechanics course. Heather joined the IDSS team in 2009 to help complete the Mass Flux/Mass Discharge guidance document, then served as a co-lead on a chapter for the IDSS document. Heather earned a B.S. in Nuclear Engineering and a B.A. in German from Kansas State University in Manhattan, KS in 1998, and continued at Virginia Tech in Blacksburg, Virginia to earn an M.S. in Civil Engineering with a Geoenvironmental Engineering emphasis in 2000 and a Ph.D. in Civil Engineering in 2006.

The Problem...

Are you tired of throwing money and time at your chlorinated solvent sites with little improvement in return?

Are you achieving your cleanup goals and/or objectives?

Is it time to think about making a change in your remedial approach?

If you are like most of us the answer is probably, "yes"

If you answered YES to the questions above, then boy do I have the guidance document for you!

Are You Dealing with These Common Site Challenges?

- ▶ Incomplete understanding of DNAPL sites
- ► Complex matrix manmade and natural
- ▶ Unrealistic remedial objectives
- ► Selected remedy is not satisfactory

Oh, what to do? Oh, what to do?

development of an integrated site remedial strategy. The list of organizations on this slide

Great mix of professionals that look at contaminant issues from differing points of view and for different client interests.

The Solution is an Integrated DNAPL Site Strategy (IDSS)

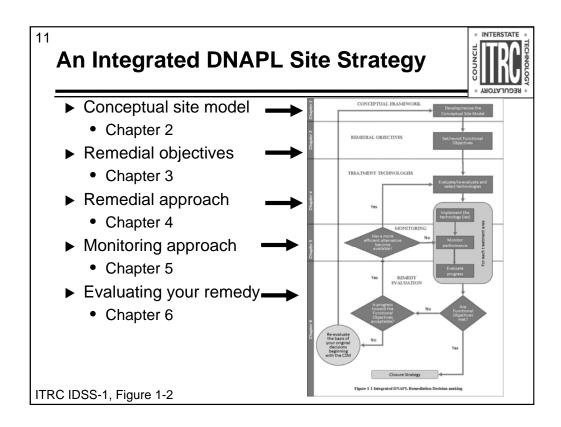

- ► Comprehensive site management
- ► When can you develop an IDSS?
  - Anytime!
- ▶ Who should use this IDSS?
  - Experienced practitioners and regulators

ITRC Technical and Regulatory Guidance Document: Integrated DNAPL Site Strategy (IDSS-1, 2011)

The ITRC Integrated DNAPL Site Strategy technical and regulatory guidance document – sometimes we will refer to it as the "Tech Reg" serves as the basis for this training class. As we move through the presentation you will see references to chapters, sections, tables, flow charts as other information to this document. If you haven't already we encourage you to download a copy and use it to help you with your DNAPL sites.

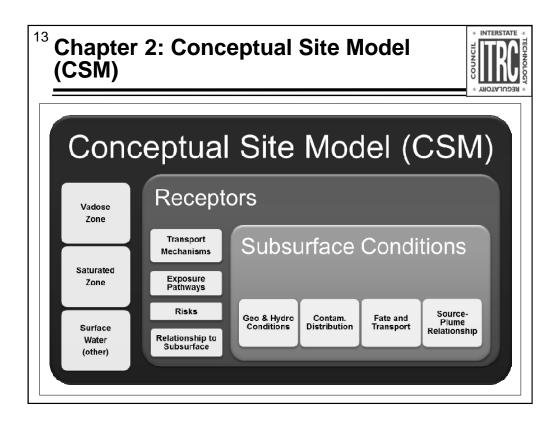

The IDSS guidance will improve the management of any remedial project

<sup>12</sup> After this Training You Should be able to:

- ► Apply the ITRC document to develop an Integrated DNAPL Site Strategy
- ► Understand the advantages of establishing SMART objectives and how to develop SMART objectives
- ▶ Understand how to monitor technology performance
- ► Effectively consider how to couple and transition treatment technologies
- ► Troubleshoot your remedial approach

The IDSS document is process-oriented, and the process starts with the CSM and then loops back to it as new information is available.

CSM – cant solve the problem if you don't understand the problem.

CSM is an organized set of ideas about a site – encompasses key elements.

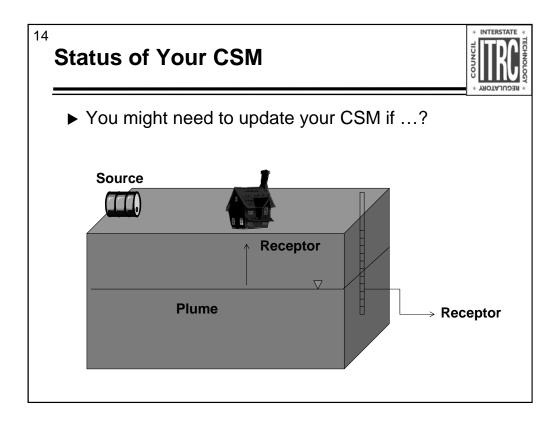

Can be presented graphically and/or in a variety of ways

CSM can be challenging to develop

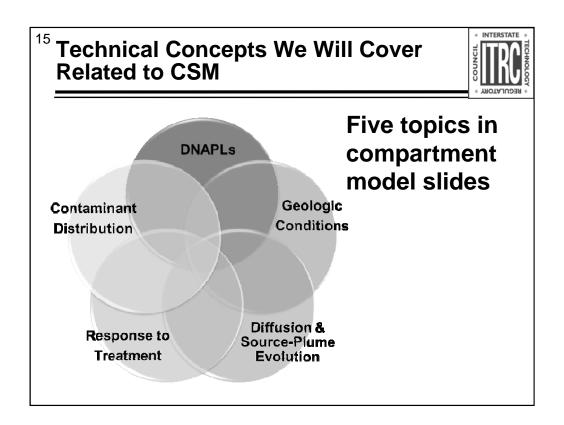

CSM is needed to support developing remedial objectives

To develop and work with a CSM as a living tool, it is necessary to understand some of the basic science and the dynamics of how DNAPLs and plumes behave in the subsurface.

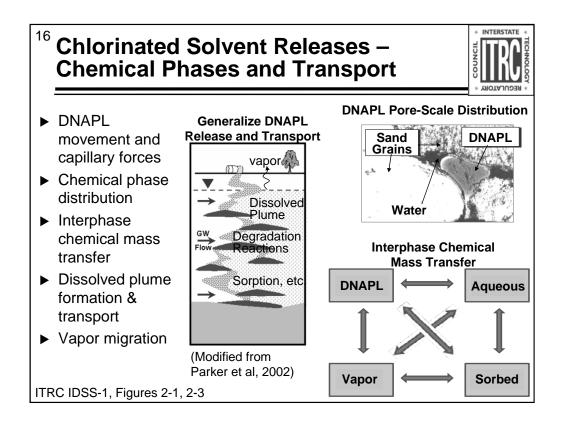

We are not going to get too bogged down in risk evaluation methods, etc. – just focusing on DNAPL sites and the unique aspects.

The current site understanding is "Black Box"

What you currently think about your CSM might change after today's presentation, so please stay with us and follow along.

A CSM has to account for the physics and chemistry of a subsurface release. "If we don't understand the problem, we probably can't solve the problem."

Main Processes in Chlorinated Solvent Releases include:

- -DNAPL movement and all related capillary phenomena
- -interphase chemical mass transfer where is your mass?
- -put it all together in 3-Dimensions and include transport and reactions.

Mobile DNAPL vs. Residual DNAPL

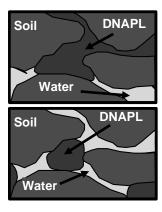

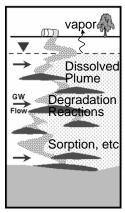

#### Mobile DNAPL

 Interconnected separate phase that is capable of migrating

#### ► Residual DNAPL

 Disconnected blobs and ganglia that are not capable of migrating

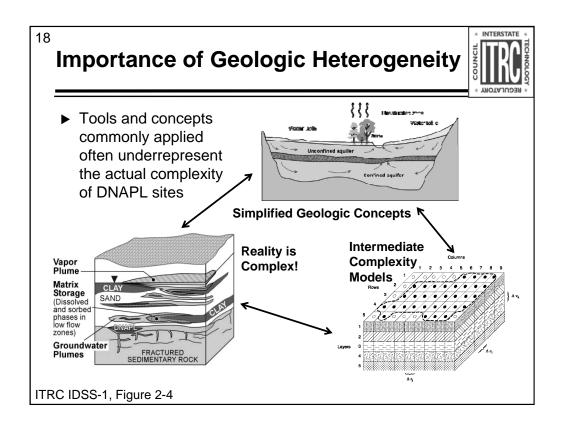

(Modified from Parker et al, 2002)

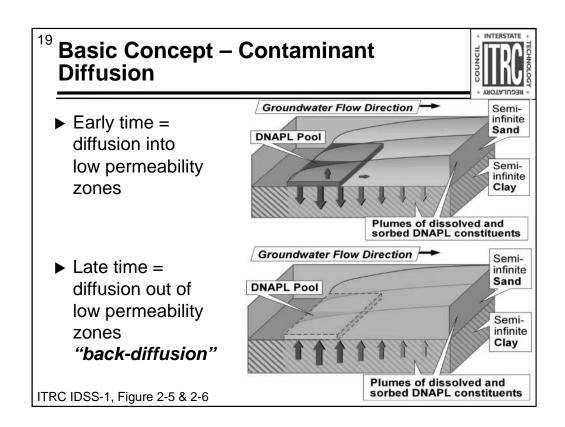

ITRC IDSS-1, Figure 2-2

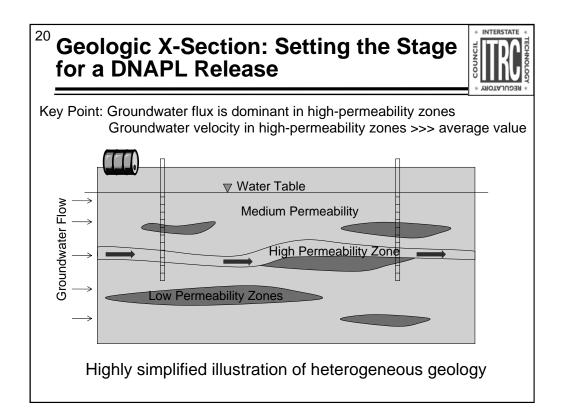

Need to consider the DNAPL itself:

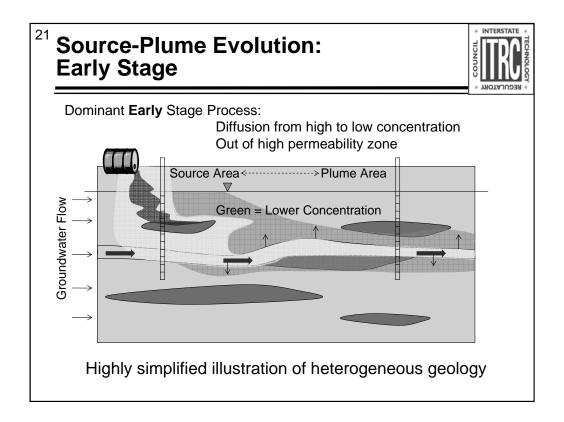

- -Is DNAPL present?
- -Even when present will be very hard to identify.
- -Just because you can't find it doesn't mean it isn't there.
- -DNAPL "pools" are rare we are more concerned with the question of DNAPL saturation and residual vs. mobile DNAPL.
- -Mobile DNAPL = interconnected at pore scale
- -Residual DNAPL (immobile) = disconnected blobs and ganglia
- -Either Mobile or Residual DNAPL is a challenge for cleanup

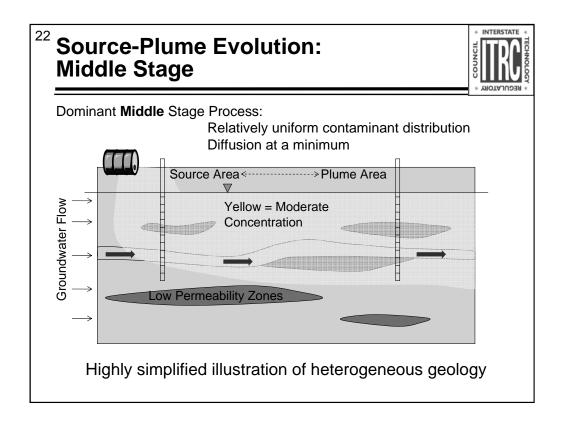

Describe how this affects your CSM and importance for decision making.

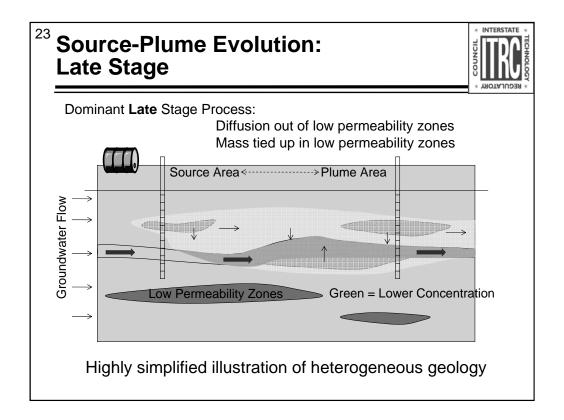

Don't actually see many DNAPL releases in "early stage". Usually after 10-20 years you have moved into middle or late stage, but early stage is important to understand as the starting point.

Can evaluate this by looking in detail at vertical delineation with respect to geologic variability. Is contaminant concentration higher in low perm zones?

Examples -

Simple = using vertical delineation with PID readings

More complex = downhole real time instruments such as MIP.

So, think about if there is data at your site that you can go back and reevaluate? Do you have data gaps? Why is it important.... Next slide.

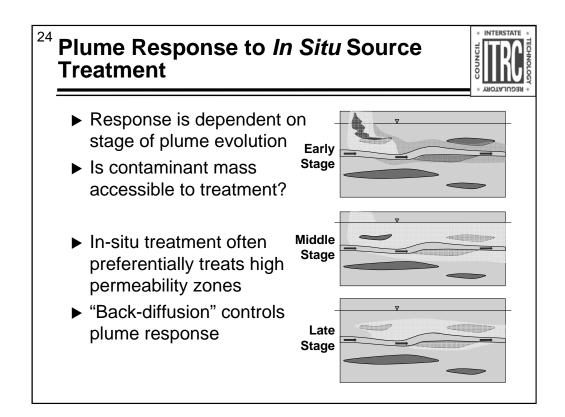

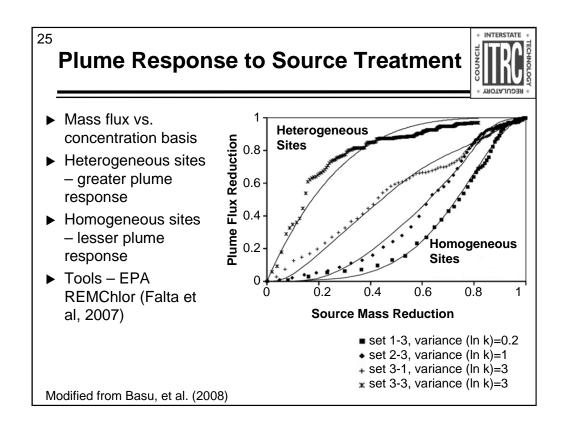

Figure represents simplified treatment result where more transmissive zone is preferentially treated.

Early Stage – Biggest bang for the buck on improvement in plume condition because diffusion out of transmissive zones has been minimal at this stage. But, we may not have treated the high concentration source unless it was specifically targeted for treatment.

Middle Stage – Worst scenario for potential back-diffusion because a large reservoir of moderate concentrations exists over a large volume that may not have been accessible to treatment.

Late Stage – Still potential for back diffusion but less so than middle stage because contaminant mass reservoir in the inaccessible zones has been depleted somewhat.

Basu et al., 2008. "Simplified contaminant source depletion models as analogs of multiphase simulators" Journal of Contaminant Hydrology 97 (2008) 87–99.

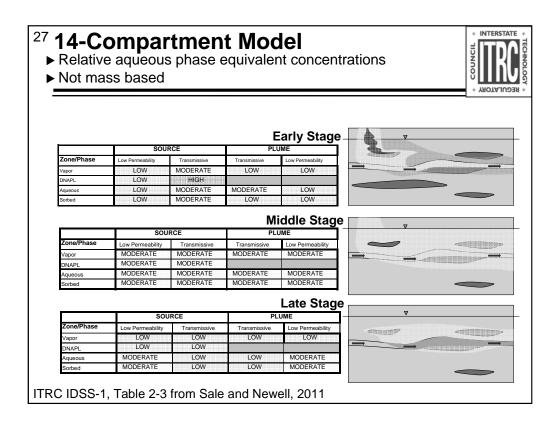

# **14-Compartment Model**

- "Compartment" consists of chemical phase within either the source zone or plume and in either transmissive or low permeability zone
- ► Highly conceptualized depiction of potential for contaminant mass flux between compartments

	Source Zone		Plume	
Phase/Zone	Low Perm.	Transmissive	Transmissive	Low Perm.
Vapor	<b>1</b>	<b>1</b>		<b>→</b>
DNAPL	•	-	NA	N A
Aqueous	*	•		<b>→</b>
Sorbed	ţ	1	•	<b>↓</b>

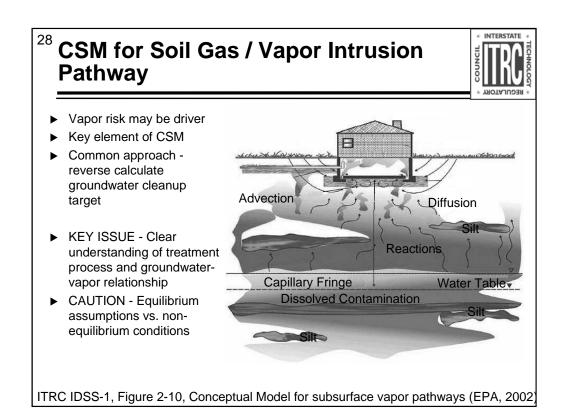

ITRC IDSS-1, Table 2-2 from Sale and Newell, 2011

Relative aqueous phase equivalent concentrations

Shows equilibrium tendencies and relative MOVEMENT OF CONTAMINANT between phases Not mass based

Does not show relative CONTAMINANTMASS DISTRIBUTION between chemical phases of in different compartments

29

## **CSM Concepts Wrap Up**

- ▶ Do you really understand?
  - Source-plume relationships
  - Transport processes and exposure pathways
  - Stage of source / plume evolution
  - How exposure concentrations will respond to treatment
- ▶ If we don't understand the problem, we probably can't solve the problem

There is always more to know, but...

Do you think you can formalize your CSM?

Are there areas of your site where you need to question your assumptions?

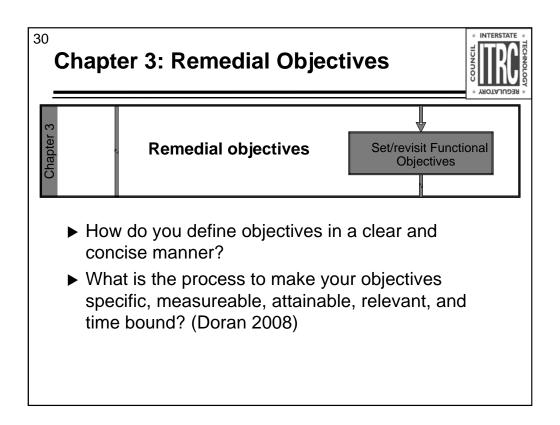

Do you think you can update your CSM?

Make this work for you, develop your CSM using any combination of graphics, maps, cross sections, data, etc.

Refer to ITRC MASS FLUX document: ITRC Use and Measurement of Mass Flux and Mass Discharge (MASSFLUX-1, 2010)

http://www.itrcweb.org/guidancedocument.asp?TID=82

Now... will briefly discuss a tool that can help in organizing your CSM and that is used later in this presentation.

SMART remedial objectives: Specific, Measureable, Attainable, Relevant, Time-bound

Stakeholder and SMART Attributes – Community stakeholders have had concerns that viable approaches are rarely chosen. Applying SMART Attributes to Functional objectives may alleviate some concern as a viable approach with long term (absolute) objectives and reasonable (functional) objectives which can be used by all parties concerned.

The specific diagnostic questions give a succinct direction to the stakeholder as to what should be asked and addressed.

3

## **Types of Objectives**

- ► Absolute objectives
  - Based on broad social values
    - Example: protection of public health and the environment
- ► Functional objectives
  - Steps taken to achieve absolute objectives
    - Example: reduce loading to the aquifer by treating, containing, or reducing source

At most sites, the ultimate objective of site restoration is to achieve MCLs in all impacted media, but this objective is often technically and/or economically impracticable within "reasonable" time frames.

32

# Functional Objectives Should be SMART

#### SMART means:

- ► Specific
  - · Objectives should be detailed and well defined
- ▶ Measureable
  - Parameters should be specified and quantifiable
- Attainable
  - Realistic within the proposed timeframe and availability of resources
- ▶ Relevant
  - Has value and represents realistic expectations
- ▶ Time-bound
  - · Clearly defined and short enough to ensure accountability

SMART acronym was develop by the American Management Association (AMA) to recognize good objectives.

Stakeholder and SMART Attributes – Community stakeholders have had concerns that viable approaches are rarely chosen. Applying SMART Attributes to Functional objectives may alleviate some concern as a viable approach with long term (absolute) objectives and reasonable (functional) objectives which can be used by all parties concerned.

The specific diagnostic questions give a succinct direction to the stakeholder as to what should be asked and addressed.

# **Functional Objectives Time Frame**

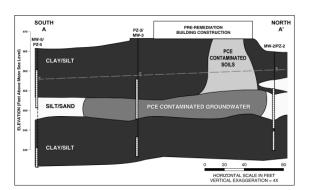

- ▶ Time frame should accommodate
  - Accountability
  - Natural variation of contaminant concentration and aquifer conditions
  - Reliable predictions
  - Scientific understanding and technical ability
- ► Team suggests 20 years or less for Functional Objectives

Site management and active remediation timeframe may continue much longer

**Example Site** 

- Potential future indoor air vapor risk – PCE in vadose zone and groundwater
- PCE in groundwater is a potential drinking water risk
- ▶ PCE in soils is a contact and ambient air
- CLEANUP 40 μg/kg and 45 μg/kg PCE in soil, 8 μg/L and 5 μg/L PCE in groundwater

ITRC IDSS-1, Figure 2-12

Cleanup value for PCE in soil that was protective of indoor air was determined to be 40 µg/kg, which was also protective for dermal exposure and ambient air exposure.

Cleanup value of PCE in groundwater that was protective of indoor air was determined to be  $8 \mu g/L$ .

Cleanup value for PCE in groundwater as a drinking water source was selected to be the drinking water standard of 5  $\mu$ g/L.

Achieving these cleanup values would allow unrestricted use of the site – enhancing the value of the property and a goal of the developer.

## **Developing a Functional Objective for** the Example Site

- ► Absolute Objectives:
  - Protection of human health and the environment
  - Redevelop the Mall Area
- ► Generic Functional Objective Not SMART
  - Vapor Intrusion Indoor Air Objective Soils **Pathway**
  - Reduce concentrations of volatile organics in the vadose zone that will allow a "No Further Action" for unrestricted use, with no engineering or administrative controls required

One of several Functional Objectives. Notice that it does not meet the SMART criteria. Must now take this an make it meet the SMART criteria

36

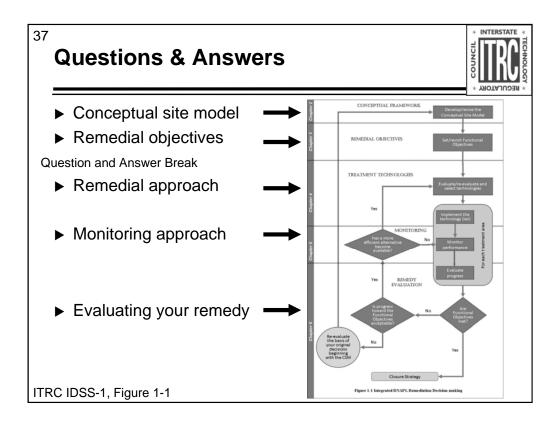

## **SMARTify the Functional Objective**

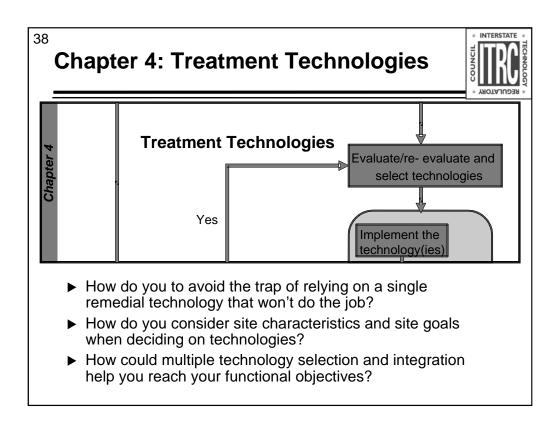

- ► SMART Functional Objective
  - Reduce concentrations of volatile organics in the vadose zone to less than 40 µg/kg within 6 months that will allow a "No Further Action" for unrestricted use, with no engineering or administrative controls required
- ▶ Meets SMART Criteria
  - Specific Yes, 40 μg/kg
  - Measureable Yes, confirmation samples
  - Achievable Yes, excavation or SVE or ISCO
  - Relevant Yes, intended use of property
  - Time-bound Yes, 6 months

The 6 month criteria was a driver provided by the developer who needed to meet a specified schedule for redeveloping the mall.

Higher concentrations might have been left in place if engineering controls and deed restrictions were to be part of the cleanup decision making. The developer wanted no such restrictions.

# **Four Parts to Section 4**

- ► Remediation technologies and assessing performance (Section 4.1)
- ► Coupling technologies (Section 4.2)
- ▶ Transitioning to other technologies (Section 4.3)
- ► Example (Section 4.4)

# **Treatment Technologies**

- ► Good summary of key technologies and performance
- ▶ No discussion of technology niches or sweet spots
  - Other technology guides are available
  - No universal consensus by IDSS team
- ► How to fit technologies into 14-Compartment Model
  - Need to estimate future performance
  - Use Orders of Magnitude (OoMs)

# **Table 4.1: Note the ITRC Publications!**

Technology Category	Example Technologies	Example Reference	
	Excavation	NAVFAC, 2007

	Solidification/Stabilization	USEPA, 2009; ITRC S/S-1, 2011	
ITRC IDSS-1, Tab	le 4-1		

Some technologies may fit in more than one Technology Category.

#### **Adding Technologies to the 14-Compartment Model Plume** Source ZONE / Low Permeability Transmissive Low Permeability Transmissive **PHASE** Tech. Perf Tech. Tech. Tech After Before After Before After After Before Before Perf Perf Perf ? ? ? ? Vapor ? ? DNAPL 0 0 ? ? ? ? Aqueous 2 ? ? Sorbed KEY: Equivalent aqueous conc. ~ 1000 μg/l - HIGH CONC. Equivalent aqueous conc. ~ 100 μg/l - MODERATE CONC. Equivalent aqueous conc. ~ 10 μg/l - MODERATE CONC. Equivalent aqueous conc. ~ 1 µg/l - LOW CONC. Needs anticipated Orders of Magnitude reduction (OoMs) You Do Simple Subtraction: (Before) - (Tech. Performance) = After These:

Technologies can be overlain on the 14-Compartment Model in order to determine if a technology is likely to achieve goals and to choose between technologies. This requires an order-of-magnitude assessment of the anticipated amount of COC reduction.

43 Order of Magnitude are Powers of 10 Why Use OoMs for Remediation?

- ▶ Hydraulic conductivity is based on OoMs
- ▶ VOC concentration is based on OoMs
- ► Remediation performance (concentration, mass, Md) can be also evaluated using OoMs....
  - 90% reduction: 1 OoM reduction
  - 99.9% reduction: 3 OoM reduction
  - 70% reduction: 0.5 OoM reduction (use equation 4.1.1)
- ► Example:
  - Before concentration 50,000 ug/L
  - After concentration 5 ug/L
  - Need **4 OoMs** (99.99% reduction)

Section 4.1.1 has a formula that converts before-and-after concentration data to OoMs.

#### Where Do You Get OoMs?

- ▶ Option 1: Your experience/knowledge
- ▶ Option 2: Data from the scientific literature
  - Multiple site studies
  - Recently released ESTCP's "DNAPL Test" System http://projects.geosyntec.com/DNAPL/dnapltest.aspx
- Option 3: Consult technology specialists / technology vendors

A practitioner's knowledge of site conditions coupled with experience using a technology under those types of conditions often provide the best source of OoMs. However the scientific literature and the opinions of technology specialists are also important resources to consider.

4!

# **Multiple Site Performance Studies**

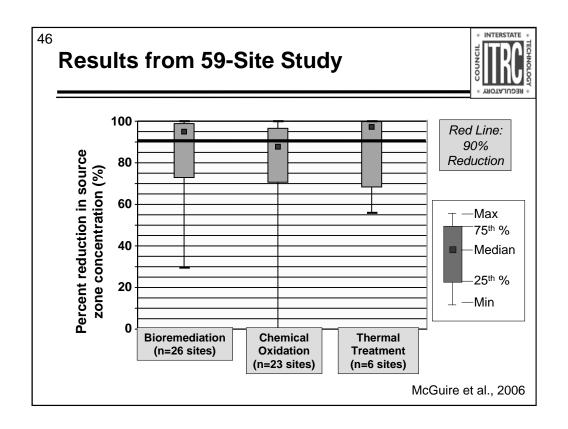

- ▶ Strong point about these studies...
  - Independent researchers, careful before/after evaluation
  - Repeatable, consistent comparison methodology
  - Describes spectrum of sites
  - Real data, not anecdotal
  - Several studies described in peer reviewed papers:

Monitoring&Remediation

Full references of these and other studies are included in the document.

Box plots are used to present average results as well as to express the amount of variability in the results. Wide variability may indicate that a technology must be designed and applied thoughtfully considering site-specific conditions.

# Others Say Use Caution....

- ▶ Not site specific
- ▶ Some lump pilot scale, full scale
- ► May not account for intentional shutdowns (i.e. they stopped when they got 90% removal)
- ▶ Don't account for different levels of design/experience
- ▶ We are a lot better now....

Multi-site studies also of important limitations to recognize, emphasizing caution in just using performance data without considering the site-specific issues.

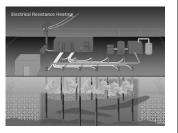

<sup>48</sup> Technology Category 1: <u>Remove</u> Physical Removal

**▶** Excavation

- ► Thermal remediation
  - Reduction in source concentration Detailed study of 14 Sites<sup>1</sup>
    - ≤ 1 OoMs at 9 sites
    - ≥ 2 OoMs at 4 sites

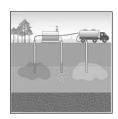

<sup>1</sup>Kingston et al, 2010

Concentration reduction (shown as OoMs) on this slide are from a multiple site study.

<sup>49</sup> Technology Category 2: React Chemical / Biological

- ▶ *In-situ* chemical oxidation
  - Median 0.3 OoMs for CVOCs<sup>1</sup>
  - This and other studies: rebound more prevalent for ISCO than other technologies

- ► In-situ chemical reduction
  - Deep soil mixing "ZVI Clay" Process: Median 1.7 OoMs<sup>2</sup>

<sup>1</sup>Krembs et al., 2010 <sup>2</sup>Olsen and Sale, 2009

Concentration reduction (shown as OoMs) on this slide are from two multiple site studies.

<sup>50</sup> Technology Category 2: <u>React</u> Chemical / Biological (continued)

- ▶ Enhanced bioremediation
  - Median 1.3 OoMs for Parent¹
  - Median **0.4 OoMs** for Total CVOCs

- ► Monitored natural attenuation (MNA)
  - Median 0.6 OoMs over average of nine years of MNA at 26 "low-risk" CVOC sites<sup>2</sup>

 Sole remedy at 30% of 45 chlorinated MNA sites<sup>3</sup>

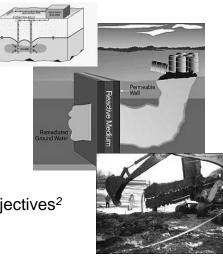

<sup>1</sup>McGuire et al., 2006 <sup>2</sup>Newell et al., 2006 <sup>3</sup>McGuire et al., 2004

Concentration reduction (shown as OoMs) on this slide are from multiple site studies. The OoMs reduction for MNA is over an average 9-year treatment period.

# **Technology Category 3: Contain**

- ▶ Pump and treat
- ▶ Permeable reactive walls
  - Zero Valent Iron Walls: Median 0.8 OoMs TCE from six sites<sup>1</sup>
- ► Low-permeability barriers
  - 83% of sites met design objectives<sup>2</sup>
- ► Solidification/stabilization

<sup>1</sup>Liang et al., 2010 <sup>2</sup>U.S EPA, 1998

Concentration reduction (OoMs) from multiple site studies. The ZVI permeable reactive wall data is derived from only from six sites, and represents change in groundwater concentration from upgradient to downgradient wells.

# **Technology Coupling (Section 4.2)**

- ▶ Three types: *temporal, spatial, simultaneous*
- ▶ IDSS team experience most common approaches:
  - Intensive technology followed by passive
  - Different technology for Source versus Plume
  - Any technology followed by MNA
- ▶ In past, "opposing" combinations (ISCO then bio) were thought to be permanent. This has proven to not be the case.

# **Rationale for Coupling Technologies**

- ► Contaminant mass, fluxes, concentration, and other factors change over time
- ► Remediation objectives can change as regulations and understanding or risk changes
- ▶ Multiple contaminants or classes may be present

# **Technology Compatibility Matrix**

- ▶ Compatibility matrix of 9 technologies
- ► Examples:
  - "Generally Compatible"
    - Thermal followed by In Situ Bio:
      - Potentially synergistic
      - Microbes population may be reduced
      - But then rapid recovery
  - "Likely Incompatible"
    - In Situ Reduction followed by In-Situ Oxidation
      - Destruction of both reagents
  - "Potentially Compatible but Not An Anticipated Couple"
    - Bio followed by Surfactant Flushing
      - Would probably work, but unlikely to be coupled

ITRC IDSS-1, Table 4-2

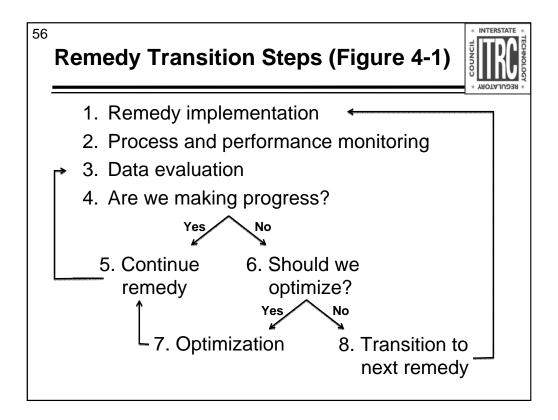

The IDSS team assessed each potential coupling for compatibility. The notes associated with the matrix provide details on the logic of how each couple was assessed for compatibility.

<sup>55</sup> Transitioning Between Technologies (Section 4.3)

### Potential Transition Triggers:

- ▶ Contaminants concentrations
  - Most likely to be contacted by the public or environment
  - Concentrations in a single key phase
- ► Contaminant phase (particularly free phase)
- ► Contaminant lineage, parent vs. daughters
- ▶ Site conditions created during method execution
- ▶ Cost per unit of contaminant destroyed

This is an adaptation of the process developed to guide the transition from any aggressive remedy to MNA that was developed by the ITRC (ITRC EACO-1, 2008). Also see Section 6 for a detailed discussion of considerations for transitioning between technologies.

ITRC Technical & Regulatory Guidance for Enhanced Attenuation of Chlorinated Organics (EACO-1, 2008)

http://www.itrcweb.org/guidancedocument.asp?tid=50

57 An Example to Pull It All Together (Section 4.4)

We want to couple:

- ▶ 14-Compartment Model
- ► OoMs
- ► Remedy Performance

To answer the question:

▶ Will I reach my objectives?

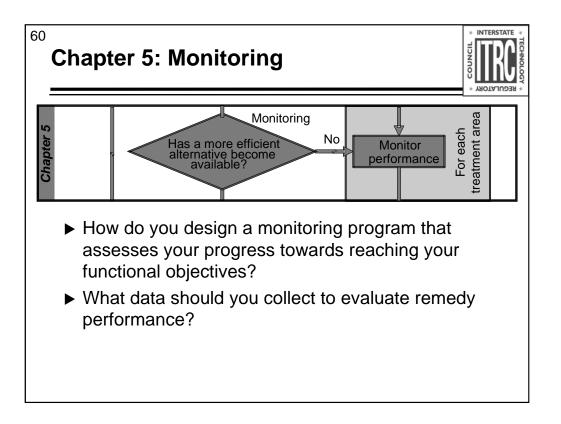

Source /	Area Ex 	cavati	Source	:e		* YROTAJU
	Low Permeability			Transmissive		
ZONE / PHASE	Before	Tech. Perf	After	Before	Tech. Perf	After
Vapor	2	3	0	3	3	0
DNAPL	0	3	0	0	3	0
Aqueous	1	3	0	2	3	0
Sorbed	3	3	0	3	3	0
	I	Key	Equivale Equivale	ent aqueous ent aqueous ent aqueous ent aqueous	s conc. ~1 s conc. ~1	00 μg/l 0 μg/l

This is only the "Source" half of the 14-Compartment Model used in the example. Excavation is assumed to completely remove the source, effectively reducing each compartment to zero. In the "Plume" source, excavation will not result in zeroes for each phase.

# **Section 4 Summary**

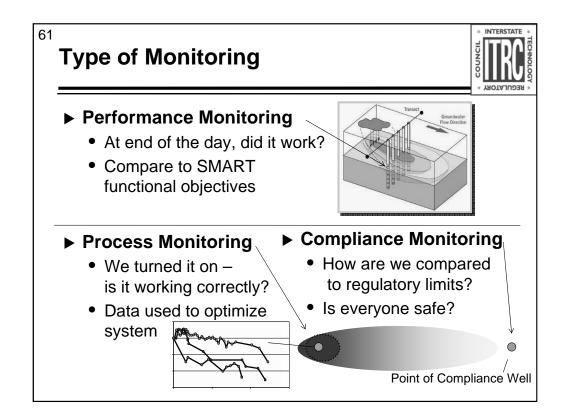

- ► Three important concepts (Section 4.1)
  - Remediation is an Order of Magnitude (OoM) affair
  - OoMs go into 14-Compartment Model
  - Get OoMs from your experience, multiple site studies, or technology experts
- ► Coupling technologies (Section 4.2)
  - Examples: Active-then-passive; Source-vs.-plume
  - Use the Compatibility Matrix (Figure 4-2)
- ► Transitioning (Section 4.3)
  - IDSS flowchart (Figure 4-1) can help

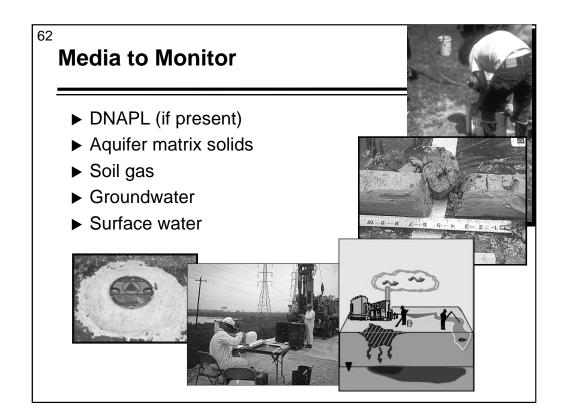

Chapter 5 helps the user determine what data are needed to monitor the site to see if the remedy or remedies are performing as hoped/expected.

Specifically, two main questions are addressed in Chapter 5 (questions on slide).

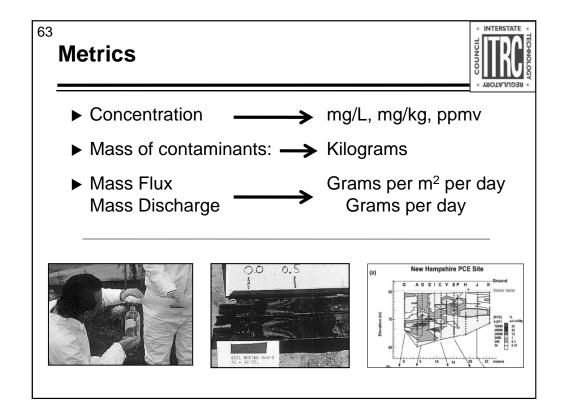

There are three main types of monitoring: performance, process, and compliance. Each type if shown in the slide with a representative example and typical questions the monitoring should answer.

- •Performance monitoring (at the top of the slide) assesses the effectiveness of the remedy in meeting the SMART objectives. The figure shows monitoring wells on a transect through the plume. Is the remedy reducing contaminant concentrations? Or, at the end of the day, is the remedy working?
- •For process monitoring (on the left hand side of the slide) the remedial system is being monitored to see if the system is meeting its functional objectives. For example during an ISCO injection, lots of system parameters are measure pressures in the lines going into the aquifer with oxidant, flow rates, etc. These types of system parameters need to be monitored to make sure that the remedial system is operating properly or to determine if system performance could be improved. Going back to the ISCO example, is one section of a site more contaminated and need for oxidant or visa versa did one section of the achieve cleanup goals faster than expected? By conducting process monitoring, the remedial system can be optimized in the field using these parameters to improve overall performance.
- •Finally compliance monitoring (on the right side of the slide) assess where the contamination levels are in comparison to regulatory limits and helps document the extent of the impact and status of exposure (if that is occurring at the site). These location are often selected through dialogue with stakeholders.

Moving to the type of media to monitor, it is important to refer to the functional objectives – they should specify what media to monitor. The potential different types of media include: DNAPL, Aquifer matrix solids (aka aquifer sediment or soil), Soil Gas, Groundwater and Surface Water.

- •DNAPL is often not seen at sites although concentrations can be quite high and indicative of DNAPL.
- •Aquifer matrix solids can help in establishing baseline contamination levels. During and after remedial efforts, additional samples can be collected to monitor progress. It should be noted that sample representativeness is a limitation. Often small samples are collected and within these small samples there can be significant heterogeneity.
- •Soil gas samples are collected if vapor intrusion is pathway of concern and could also be used as a qualitative screening tool to detect DNAPL source areas in the unsaturated zone.
- •Groundwater is the ubiquitous media to monitor. Regulations are base on the media and mass flux/mass discharge are measured in these media.
- •Surface water can be media to monitor depending on site conditions. For example, when contaminated ground water is discharging to a surface water body.

The metrics for monitoring the media on the previous slide are summarized here.

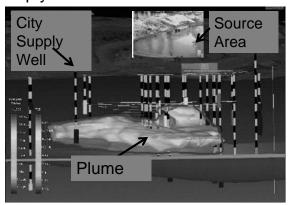

- •Concentration can be for groundwater, aquifer matrix soils, or soil gas.
- •Mass of contaminants is typically in SI units kilograms.
- •Mass Flux is grams per square meter per day. Integrated over the area, mass discharge is in units of grams per day. For more information on mass flux and mass discharge, please see the ITRC Mass Flux-1 guidance document and training currently being provided.

ITRC Use and Measurement of Mass Flux and Mass Discharge (MASSFLUX-1, 2010) http://www.itrcweb.org/guidancedocument.asp?TID=82 Internet-based training: http://www.cluin.org/conf/itrc/ummfmd/

### **Data Evaluation**

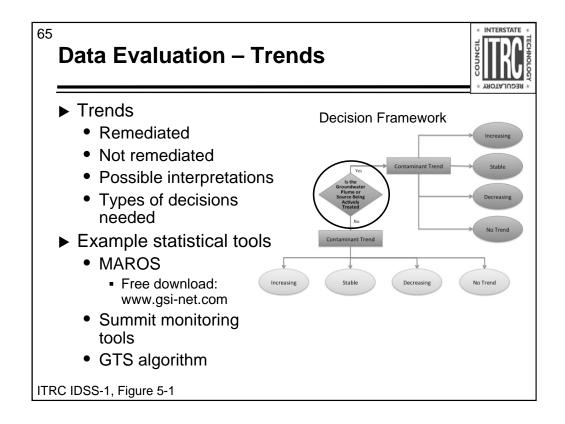

- ► Key concept: *Maintaining* and *Improving* the Conceptual Site Model
  - Visualization tools can help
  - Stats help you understand trends

After determining what data are relevant to your site, this slide moves into the data evaluation portion of Chapter 5.

- •As noted by Chapter 2 speaker, the conceptual site model (CSM) must be maintained and viewed as a living document. As data are collected during remedy implementation, these data should be incorporated in the CSM. This will help improve understand of the site as well as evaluate remedy performance.
- •Visualization tools (as shown here) can help the project team as well as stakeholders better understand the site and its progress over time.
- •Additionally, statistics can help identify and determine trends.

- •Trending One of most common statistical methods; is way to quantitatively describe the rate at which change is occurring
- •Establishes rate at which functional objectives are being achieved and be used predicatively to estimate time required to achieve the objective
- •Figure is one from the Chapter 5 that illustrates a decision framework from which to begin the data trend interpretation process

Begin at the text box circled in red

Step 1: Answer the question whether or not plume is being remediated

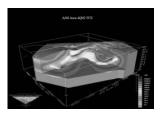

Step 2: Follow arrow to appropriate contaminant trend; blue - indicating remediation is occurring, or orange - indicating the remediation is not occurring

After establishing the behavior of your monitoring results from this figure you can refer to two tables (5-2 and 5-3) within the document that offer "Possible Interpretations" and "Types of Decisions Needed" based upon the trend.

# **Modeling for Performance Monitoring**

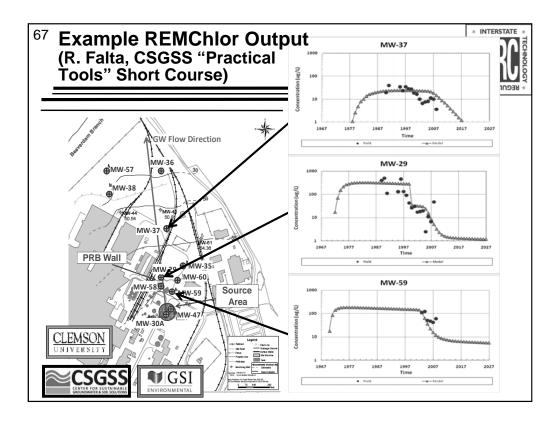

- Source zone models
  - Simulates impact of remediation or MNA on source
- ▶ Fate and transport models
  - Evaluates plume stability
- ▶ Example:
  - REMChlor Search "REMChlor EPA"
  - NAS Search "Natural Attenuation Software"

In addition to data trends, modeling the system can be a helpful and informative exercise. The use of modeling results should be used with other data to make an informed decision. Modeling should not be the sole basis for a decision.

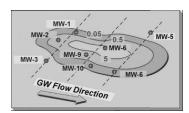

- •Source zone models can simulate what the impact of remediation on source zone could be.
- •Fate and transport models attempt to model or simulate the 2 and 3 D plume movement. Typically, models are used to evaluate plume stability.
- •For free model downloads, REMChlor and NAS (Natural Attenuation Software) are available. Each provides similar analyses and require data through the center line of the plume.

# **Optimizing Monitoring**

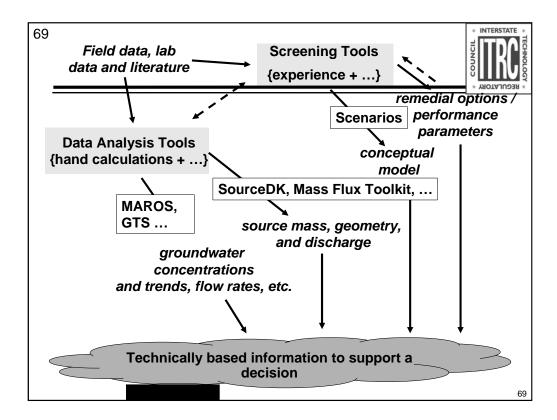

- ▶ Monitoring network
  - Any redundant wells or data gap area?
- ► Frequency and duration
  - Do I need to sample quarterly? Lots of research.
- ► Contaminant and constituent
  - Can 1 or 2 compounds explain the big picture?
- ► Key tools:
  - MAROS and GTS

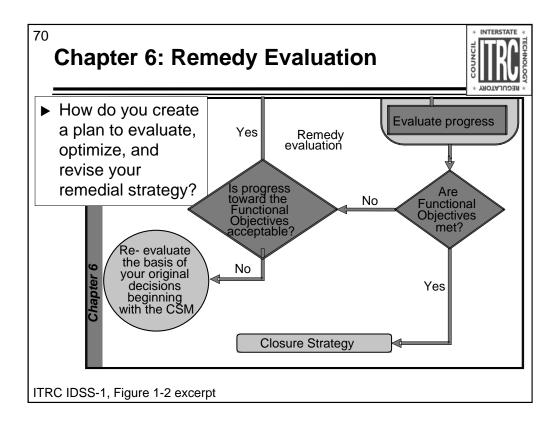

Finally, optimizing monitoring plans must be addressed. Over the timeframe of remedial action operation and into long term monitoring, the monitoring plan should be evaluated. Is the monitoring network still applicable? Are some wells already clean? Do they still need to be monitored? What about the frequency of monitoring? Maybe quarterly sampling isn't required once the plume is decreasing in size. Have the contaminants shifted? Are all analytes required? These are questions that should be asked when compiling monitoring reports and recommendation for changes in the monitoring strategy should be routine.

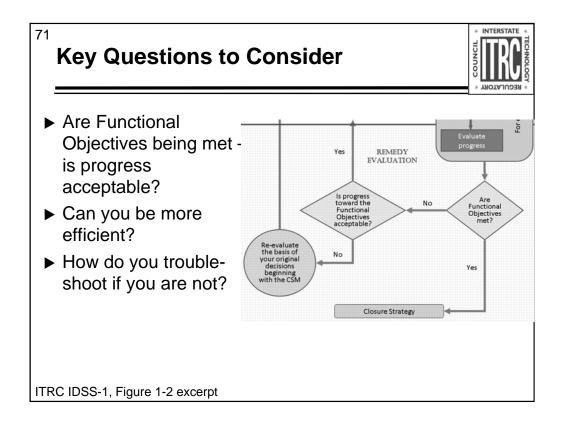

As with modeling, there are several free tools available online – MAROS and GTS are examples.

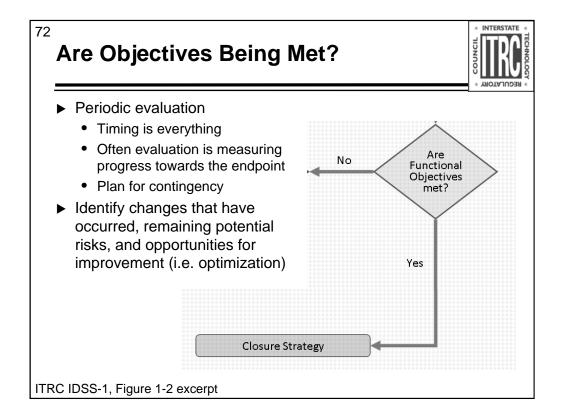

Finally, the monitoring strategy should oversee the collection of data with the understanding of how the data are to be evaluated. Will screening tools (right side) be used? Are certain parameters needed for the models? Or will Data Analysis Tools be used? Will all these options be used to feed into the cloud?

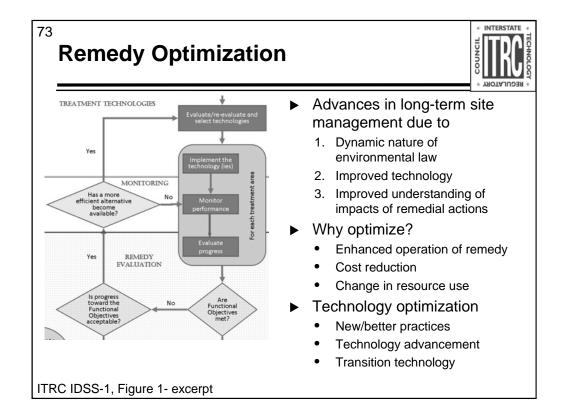

Now that a monitoring strategy has been discussed and the basis of data trends, the entire remedy evaluation can proceed in Chapter 6. As shown in the figure, the feedback loop here asks where the remedial strategy is.

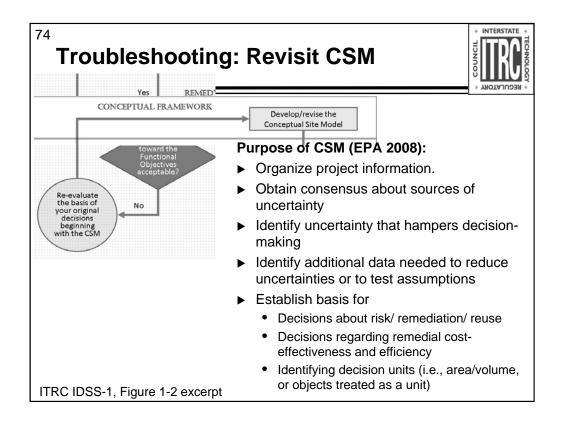

Currently, re-evaluation of sites that are not meeting objectives often focuses on technology application without also re-evaluating whether the CSM or the absolute and functional objectives are impeding measureable progress.

If a CERCAL site, does a 5-yr review provide sufficient time for review? Specifically, can progress be seen during the review? Therefore, review periods need to be consistent with timeframe of the functional objectives.

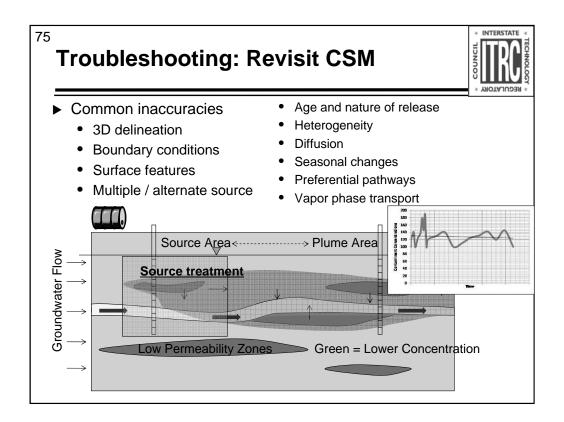

Remedy Optimization important for determining whether best practices have been implemented at the site.

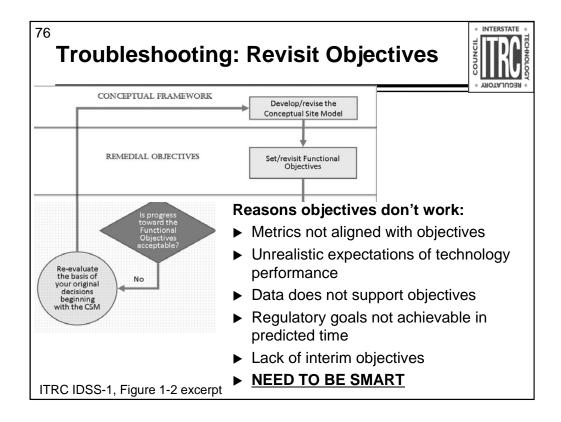

We start looking at the third question for this chapter. "How do I trouble shoot if the functional objectives are not being met at an acceptable rate?"

Basically, you loop back to the top of the flow chart. Back up to the CSM discussion. Let's revisit the purpose of a CSM. A CSM incorporates all the available information from a site into a common understanding. This common understanding provide the basis for decisions – remedies, need for additional investigation, and recognition of uncertainty at the site.

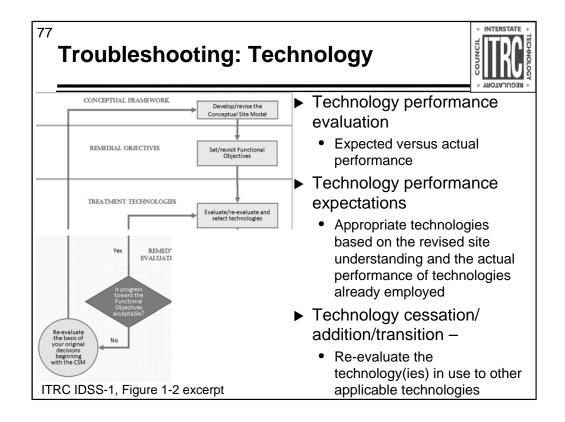

As CSMs at chlorinated solvent site are complex, minor inaccuracies in one or more elements can be multiplicative and compound the error in understanding the site. Typical components of the CSM related to the source zone and plume structure are listed here. You can see how these items are interdependent.

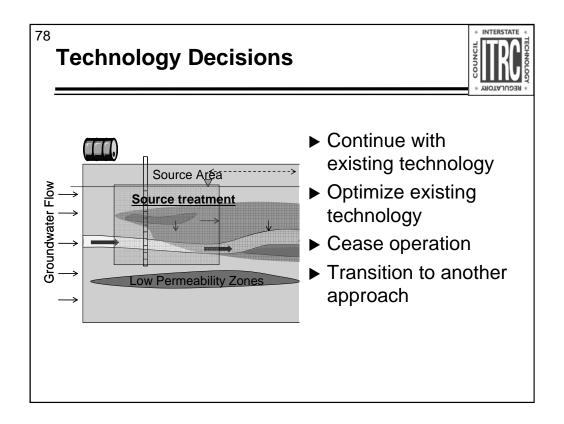

After addressing concerns in Section 2, let's move to Section 3 and revisit the objectives.

- •Metrics do not mesh with functional objectives or could be miss-applied metrics such as using residential standard in an industrial setting.
- •Unrealistic expectation of technology performance remedies for DNAPL were often developed assuming that ONE technology would achieve closure requirements. But we known now these expectations are often not realistic.
- Data do no support objectives meaning the data do not help evaluate the objectives or determine if the remedy is approaching the functional objectives.
- •Regulatory goals and lack of interim objectives go together in that if goals go beyond a generation (as noted previously in this training), then interim goals should be developed to help track process.

Once the objectives are all ironed out, begin troubleshooting the technology.

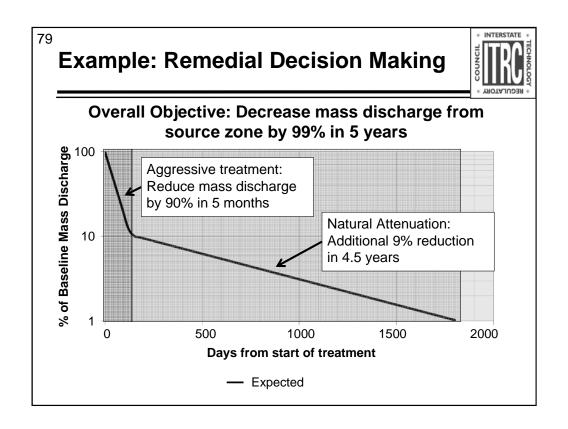

The information from the three categories on the previous slide come together to make decision regarding whether to:

Continue with existing technology

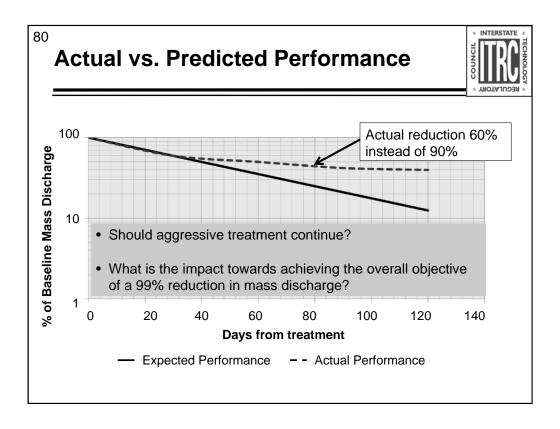

Optimize existing technology

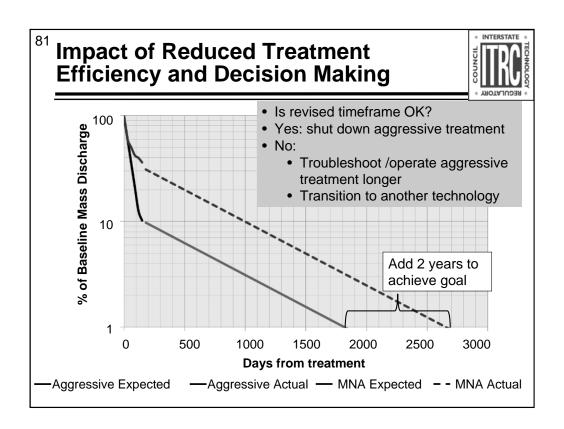

Cease operation

Transition to another approach

To illustrate the technology implementation decision points, let's cover an example.

82

## **Remedy Evaluation Summary**

- ► CSM is a living document
- ▶ Functional objectives must be SMART
- ▶ Plan transitions to other technologies
- ► Repeated performance evaluation
- ► Reevaluate your Strategy (IDSS)

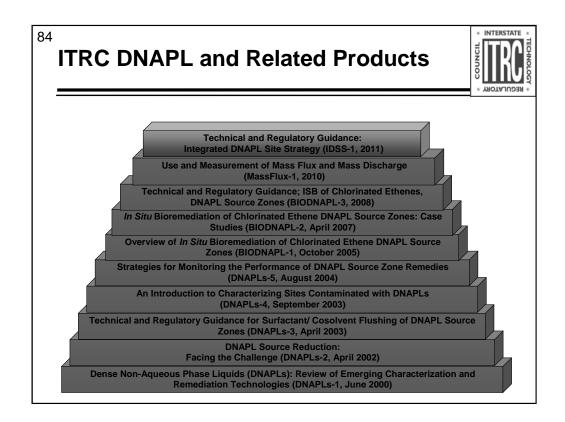

83

## **Course Summary**

- ▶ Maintain and improve conceptual site model
- ► SMART functional objectives
- ► Multiple technologies
- ▶ Iterative performance evaluation
- ► Reevaluate your strategy
- ► Regulatory issues

An IDSS creates an accurate, comprehensive management model for sites where chlorinated solvent occurs in multiple phases and is remediated using several methods over an extended period of time and under conditions of uncertainty and change

As you will see on this slide, there are 10 other DNAPL-based documents in addition to the document we discussed today (as seen in Blue). We encourage you to visit the ITRC website and download those documents.

Now I will turn it over to the moderator.

## The benefits that ITRC offers to state regulators and technology developers, vendors, and consultants include:

- ✓ Helping regulators build their knowledge base and raise their confidence about new environmental technologies
- √Helping regulators save time and money when evaluating environmental technologies
- ✓ Guiding technology developers in the collection of performance data to satisfy the requirements of multiple states
- √ Helping technology vendors avoid the time and expense of conducting duplicative and costly demonstrations
- ✓ Providing a reliable network among members of the environmental community to focus on innovative environmental technologies

## How you can get involved with ITRC:

- ✓ Join an ITRC Team with just 10% of your time you can have a positive impact on the regulatory process and acceptance of innovative technologies and approaches
- ✓ Sponsor ITRC's technical team and other activities
- ✓ Use ITRC products and attend training courses
- ✓ Submit proposals for new technical teams and projects
