## **Introduction**

### **1.1 Background**

Sangamo-Weston (Schlumberger) owned and operated a capacitor manufacturing plant near Pickens, South Carolina. The plant began operation in 1955 and manufactured capacitors and other related electrical components until the business was sold in 1987.

On June 18, 1987, Schlumberger and the United States Environmental Protection Agency (USEPA) Region 4, signed an Administrative Order of Consent that specified actions to assess the presence and extent of waste constituents in soil and groundwater at the Plant Site. Project planning documents were submitted and approved in January 1988. Following completion of the remedial investigation/feasibility study (RI/FS) the USEPA issued its Record of Decision (ROD) in December 1990, which called for soil and groundwater remediation.

RMT, Inc. (RMT) designed and implemented remedial activities as required and in an effort to accelerate the groundwater remediation, RMT performed horizontal delineation of potential source areas (Phase 1) in March 2007 and a residual source investigation (Phase 2) in June 2007. These investigations focused on the Former Plant Area and Areas D and H as potential source areas for volatile organic compound (VOC) detections in groundwater. Based on the results of the Phase 1 and Phase 2 investigations and in collaboration with Schlumberger's Water Services group, pilot soil vapor extraction (SVE) well locations were selected and SVE was chosen as a potential source remedy.

### **1.2 Source Investigations**

On February 15, 2007, RMT submitted a workplan to the USEPA and South Carolina Department of Health and Environmental Control (SC DHEC) to conduct a residual VOC source investigation for the Plant Site. This source investigation focused on the Former Manufacturing Building, and former suspected source areas D, G, and H. A workplan for Phase 2 of the residual VOC source investigation, as well as a summary of results from the Phase 1 investigation were submitted to the USEPA and SC DHEC on May 15, 2007.

The Phase 1 investigation was conducted in March 2007 using soil vapor screening and real-time field analyses to determine the horizontal limits of residual source material. The data indicated that residual VOCs were present in the subsurface beneath the western half of the Former Manufacturing Building, Area D, and Area H. The Phase 2 workplan included profiling

the saprolite lithology and delineating the vertical extent of residual VOCs. The Phase 2 investigation was conducted in June 2007.

On October 16, 2007, RMT submitted the findings of the Phase 2 residual VOC source investigation to USEPA and SC DHEC. Vertical delineation of soil gas concentrations were presented, showing the distribution of VOCs in the source zone. Profiles of the general lithology and microstructures of the saprolite typical of those found in the residual source areas were also presented in the October 16, 2007 submittal. The results of the two phases of supplemental source delineation indicated that a potentially significant mass of residual VOCs remained in the saprolite zone beneath the former Plant Site Area, Area D, and Area H. Therefore, the focus of remediation technologies was placed on addressing the residual VOCs in the unsaturated saprolite zone in the Former Plant Site Area, Area D, and Area H using SVE Technology. The source areas targeted were based on the Phase 1 and Phase 2 horizontal and vertical residual source delineations.

### **1.3 Pilot Testing Objectives**

The objectives of the SVE pilot test were to:

- Evaluate the effectiveness of SVE in removing residual VOCs from the vadose zone within the source areas identified above. The VOCs observed in the subsurface are thought to be contributing to the continuing high concentrations of VOCs in the groundwater down gradient from the source areas.
- Estimate the total VOC mass present in each source area and evaluate if a full-scale SVE approach could be used to effectively address residual source removal.

## Section 2

# Soil Vapor Extraction Well Installation

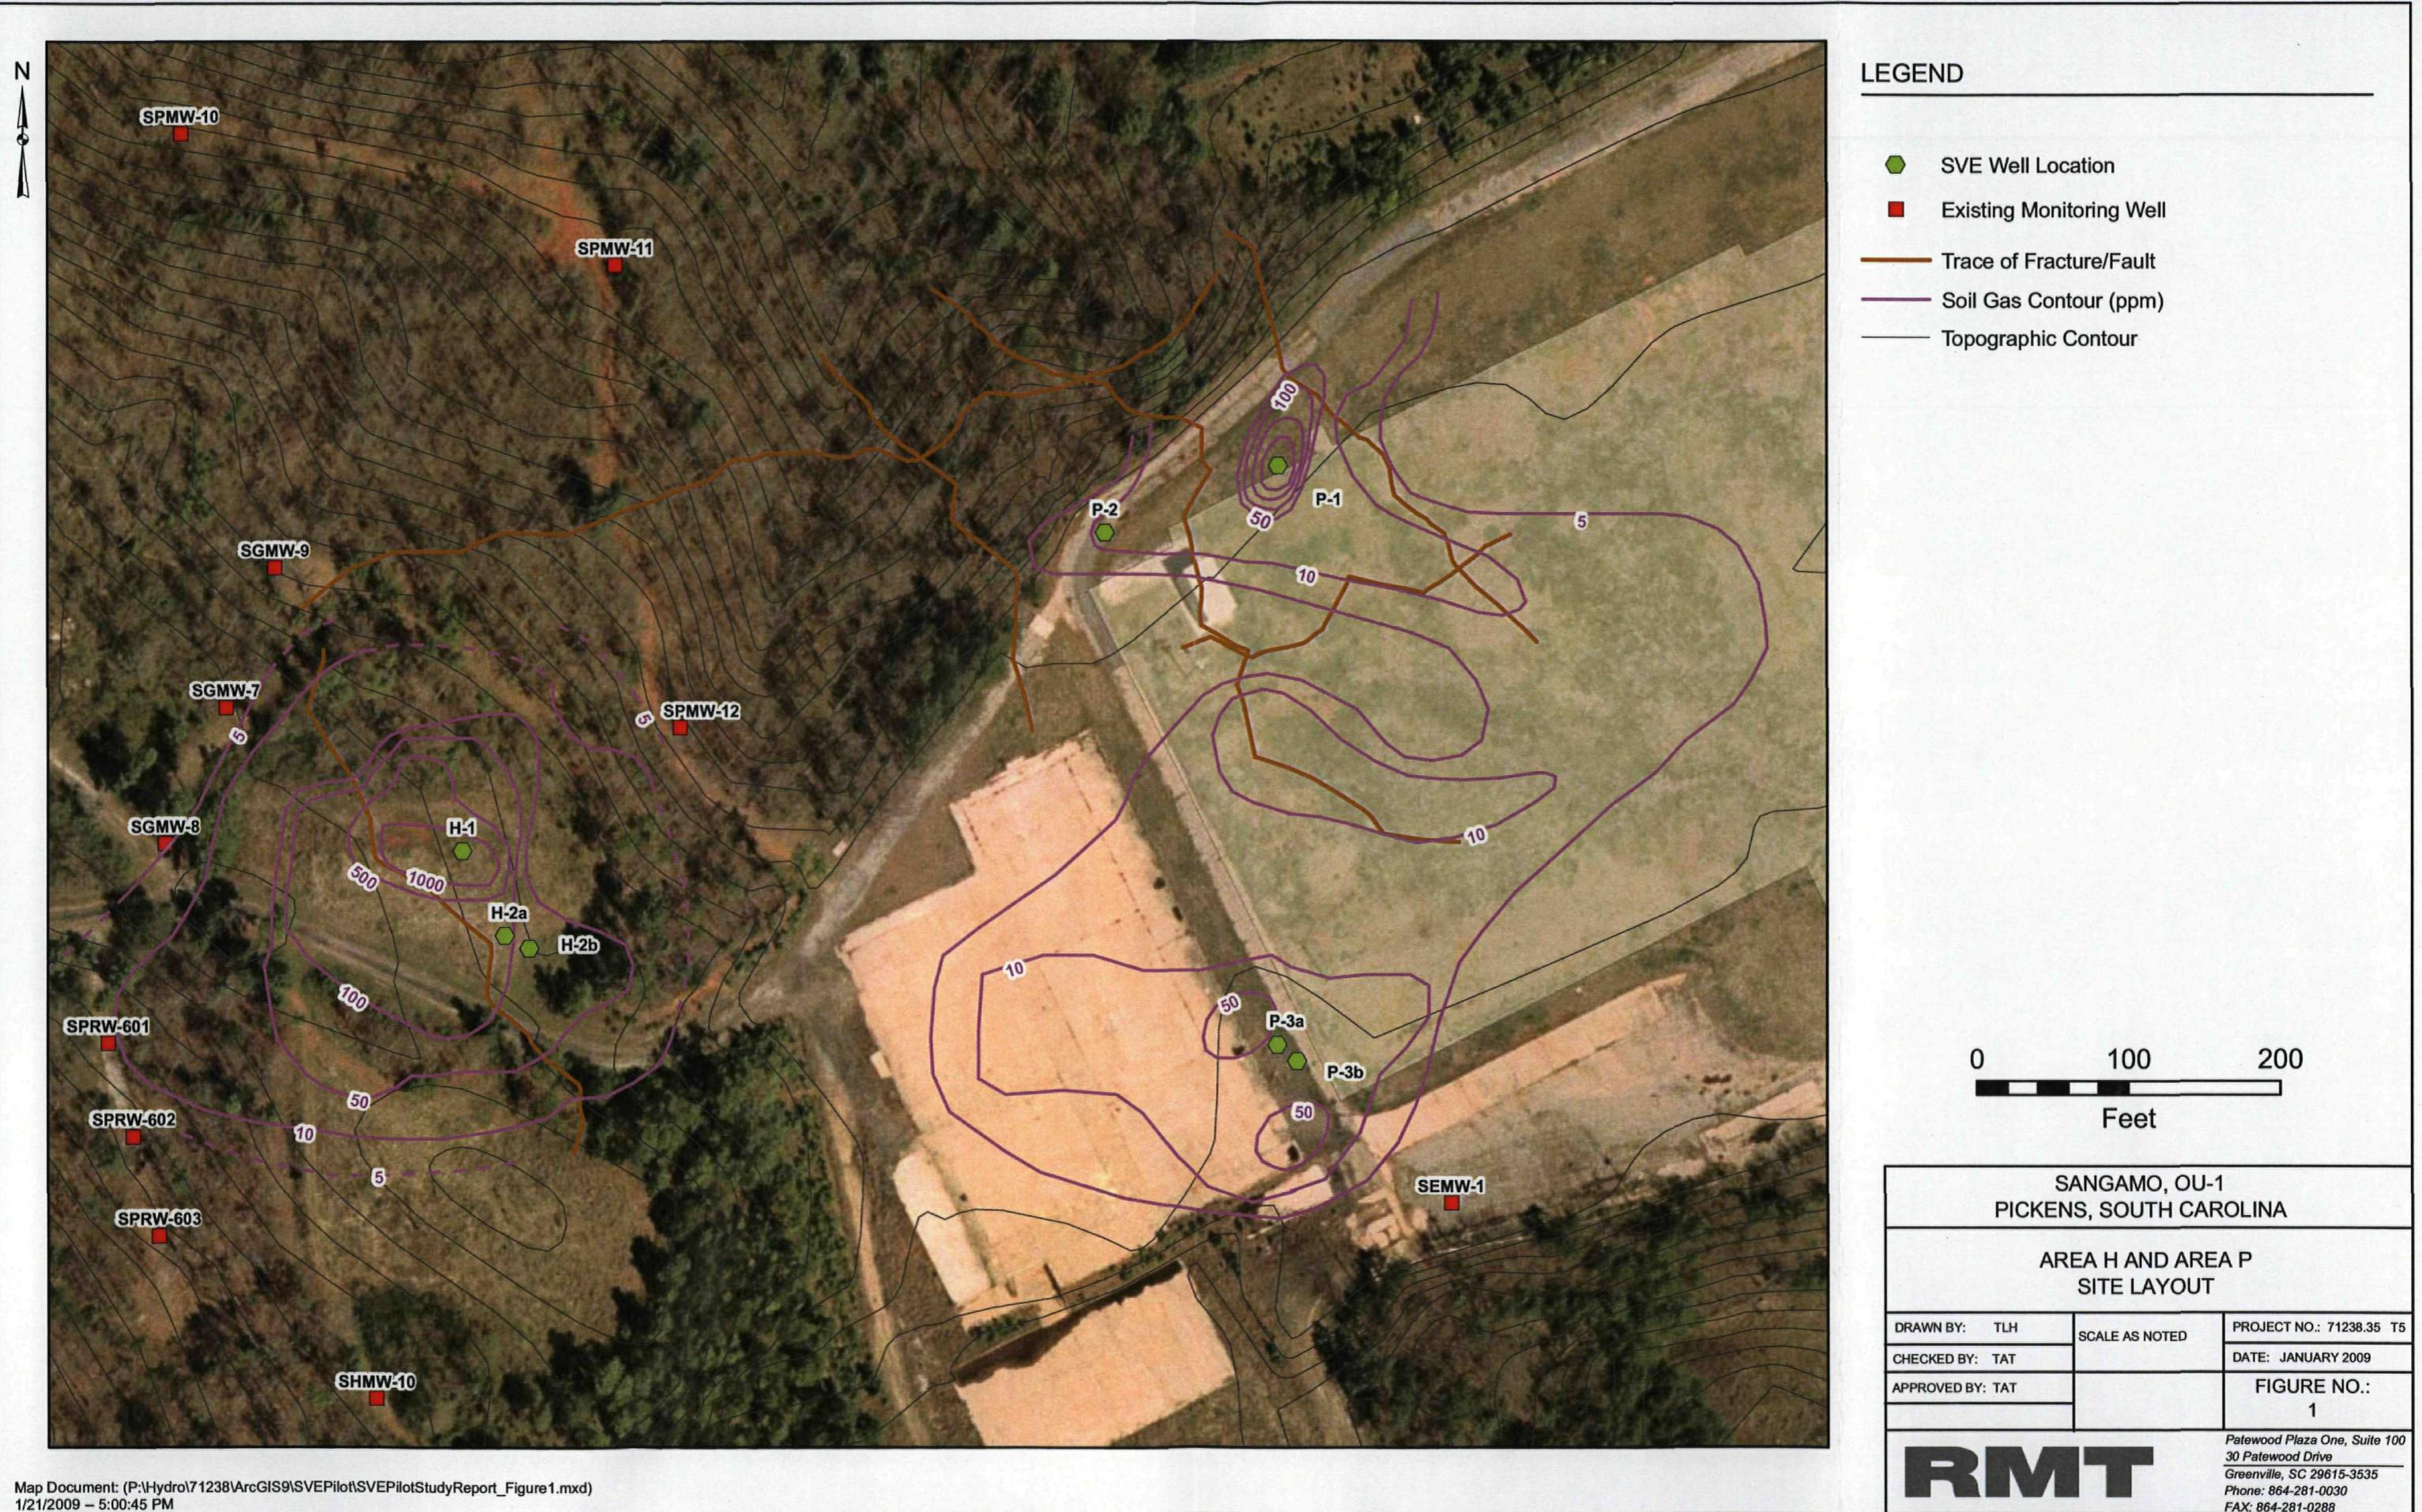

A total of nine 4-inch polyvinyl chloride (PVC) SVE wells were installed in July and August, 2008, at locations selected on the basis of the Phase 1 and Phase 2 source investigations. Table 1 is a summary of the SVE well construction and locations. The locations of the SVE wells, overlain on the technical data used to select the locations (e.g., soil gas concentrations and bedrock fractures determined by the geophysical survey) are shown on Figures 1 and 2. Well construction diagrams are provided in Appendix A and soil boring logs are provided in Appendix B.

**Table 1**  
**Well Installation Summary**

SVE WELL ID	WELL SCREEN INTERVAL (ft bgs)	TOTAL DEPTH (ft bgs)
<b>Plant Area</b>		
P-1	15.0 – 35.0	35.0
P-2	36.5 – 61.5	61.5
P-3a	12.0 – 27.0	27.0
P-3b	26.5 – 41.5	41.5
<b>Area H</b>		
H-1	13.5 – 23.5	23.5
H-2a	10.0 – 25.0	25.0
H-2b	24.0 – 34.0	34.0
<b>Area D</b>		
D-1	25.0 – 35.0	35.0
D-2	10.0 – 20.0	20.0

The SVE wells were constructed of nominal 4-inch diameter PVC casing with pre-packed PVC screen segments. Wells were installed using conventional hollow-stem auger drilling technology. The wells were advanced to auger refusal. Screen length, as shown in Table 1, was varied at the SVE well locations to intersect the impacted soil horizons identified during the supplemental source delineation. The top of the screened interval was set at a minimum depth of 10 feet below ground surface (bgs) to minimize potential short-circuiting with atmospheric air. Split-spoon samples were collected at five foot intervals, and soils were described in general accordance with the Unified Soil Classification System (USCS).

Depth to bedrock beneath the site ranges from 3 feet bgs (monitoring well SWMW-4) to 62 feet bgs (SVE well P-2). Soils overlying the bedrock consist primarily of fine to coarse-grained silty sand saprolite throughout the site. Quartz, feldspar, and mica are the most prominent minerals, with some areas intruded by granitic dikes. Groundwater beneath the site is encountered below the bedrock surface.

## **Section 3**

# **System Design**

The SVE unit flow rate and vacuum pressures were based on the design parameters for the Area D system, which operated from September 1998 to June 2002 at the site. Regenerative type blowers were chosen for the skid-mounted SVE units as a result of their ability to produce the desired vacuum pressure of 100 inches of water column (w.c.) while maintaining a relatively high rate of air flow. Regenerative blowers can generally sustain a higher air flow rate at 100 inches of w.c. than rotary or liquid-ring positive displacement pumps. Blower specifications are presented in Appendix C. Table 2 is a summary of each SVE unit.

**Table 2**  
**Unit Design Parameters**

LOCATION	SVE WELL ID	SVE SYSTEM TYPE	SVE UNIT FLOW RATE (scfm)
Former Plant Site	P-1, P-2	Skid-mounted	200 – 250
Former Plant Site	P-3a, P-3b	Skid-mounted	200 – 250
Area H	H-1, H-2a, H-2b	Skid-mounted	300 – 350
Area D	D-1, D-2	Skid-mounted	200 – 250

Each SVE unit consisted of a 55-gallon knockout drum to remove condensate from the extracted air stream, an air filter to remove particulate matter (PM), and an in-line make-up air valve prior to the blower. The knockout drum contained a vacuum relief valve set to open at 100 inches of w.c. to protect the blower in the event of a limited flow and high vacuum pressure situation. A vacuum gauge was also attached to the knockout drum. Downstream of the blower, the exhaust was routed through a 55-gallon activated carbon drum before being released through a stack to the atmosphere. The stack contained a sample port and in-line flow meter.

Each skid-mounted unit consisted of a two zone manifold (Plant Area and Area D wells) or a three zone manifold (Area H). Each manifold contained an in-line flow meter, vacuum gauge, sample port, and ball valve to control flow to each well. A temperature gauge was attached to the header at the tie in of the manifold. Photographs of the SVE units and manifolds are presented in Appendix D.

## **Section 4**

### **Air Permitting Exemption**

---

After each SVE unit had been designed, RMT sent a letter to SC DHEC to exempt the pilot study from obtaining an air emissions permit in accordance with South Carolina Air Pollution Control Regulations and Standards (SC Regulations 61-62). SC DHEC exempted the site under SC Regulation 61-62.1, Section II(B)(2)h, because it has been determined that the alteration will have a total uncontrolled emission rate of less than 1,000 lbs/month of VOCs. Correspondences relating to the air permitting exemption are presented in Appendix E.

## Section 5

# System Operating Parameters

Area H and Area D units were started on September 3, 2008. Plant area wells were started on September 8, 2008. During the pilot test period, air flow, vacuum, and temperature were measured at the manifold and/or discharge stack. Operating parameters were measured on sample collection days. Variations in temperature were dependant on ambient temperature and air flow rate, and fluctuations in flow and vacuum pressure were minor. Flow measurements were read directly from the in-line flow meters present on each manifold and the discharge stack, given in standard cubic feet per minute (scfm). Vacuum for each well was read from a vacuum gauge located on each extraction well's manifold line, as well as from a composite system vacuum gauge located on the knockout drum. A complete table listing SVE operating parameters is presented in Appendix F. A summary table of average operating parameters for each of the four SVE units is presented in Table 3.

**Table 3**  
**Operating Parameter Summary**

SVE WELL ID	AVERAGE VACUUM PRESSURE (in. H <sub>2</sub> O)	AVERAGE TEMPERATURE (°C)	AVERAGE FLOW (scfm)
P-1, P-2	58	81	110
P-3a, P-3b	63	84	85
H-1, H-2a, H-2b	46	82	150
D-1, D-2	46	93	<25

A GasTec® 100 mL sampler was used to draw air samples through trichloroethylene (TCE) indicator tubes from the well sample ports during each sampling event and from the stack during baseline sampling. Sample results were adjusted using temperature correction factors provided by GasTec® after sample measurements had been taken. A manual pump was used with SKC Inc. charcoal sorbent tubes to collect samples for laboratory VOC analysis (Method N1003) as shown on the sampling schedule presented in Table 4.

**Table 4**  
**Sampling Schedule**

OPERATING DAY	OPERATING PARAMETERS	TCE INDICATOR SAMPLE	CARBON TUBE SAMPLE
1 (baseline)	X	X	X
2	X	X	
3	X	X	X

OPERATING DAY	OPERATING PARAMETERS	TCE INDICATOR SAMPLE	CARBON TUBE SAMPLE
7	X	X	X
14	X	X	X
28	X	X	X
42	X	X	X
130	X	X	

SVE Well D-1 produced very low air flow rates (<5 scfm) during operation of the SVE system in Area D. This well was screened in a clayey silt layer which was not characteristic of the soil types encountered at the other locations and may have contributed to the low flow rate. RMT discontinued operation of SVE Well D-1 on September 18, 2008. In an attempt to stimulate flow and determine if the reduced flow was due to skin effects caused by the drilling process, the well was filled with a surfactant dose recommended by the licensed driller who installed the well, surged, and redeveloped. The well was refilled with water each weekday until September 25, 2008, and the water was allowed to seep out into the surrounding formation. The formation was observed to be accepting the water at a rate of approximately 0.8 gallons per minute (gal/min).

On September 25, 2008, the licensed driller was on the site with a boom truck and four inch surge block. The well was repeatedly filled with water and surged in an attempt to remove any clayey soil that may have been smeared on the well screen during well installation. Moderate changes in formation permeability were observed when the well was again filled with water, but no change in air flow was observed once the well was drained and reconnected to the SVE unit. The well was left connected to the SVE system for the remainder of the pilot study.

## Section 6 Results

Laboratory analysis of the carbon tube samples resulted in detections of TCE and perchloroethylene (PCE) in varying concentrations among the SVE wells sampled. VOCs were not detected in air samples collected from sample ports located downstream of the activated carbon drums following startup of the SVE units. Laboratory reports from each sampling event are presented in Appendix G.

Concentrations of TCE and PCE dropped rapidly in the first five days of the SVE pilot test. Figure 3 shows the rapid decline in measured PCE concentrations over time from the three wells with the highest mass extraction rates (H-1, H-2b, and D-2). Figure 4 shows the decline in mass removal by date.

Almost 90 percent of the total mass of TCE and PCE removed was from three of the nine SVE wells (206 lb out of a total of 235 lb). Based on the results from the Phase I and Phase II soil gas studies, the largest residual mass of TCE and PCE were expected to be extracted from Area H. The pilot study corroborates this assessment, with a total mass removed of TCE and PCE of 192 lb. from Area H during the six week trial. Initial soil gas readings in Area P wells were lower than the Area H, and the estimated mass of contaminated soil was less, but the relatively small quantity (12.11 lb) of TCE and PCE removed was unexpected. Table 5 provides a summary of the total mass removed from each well.

Table 5  
Total Mass Extracted

SVE WELL ID	TCE (lb)	PCE (lb)
P-1	0.6	2.39
P-2	.29	1.85
P-3a	0	3.10
P-3b	.44	3.44
H-1	63.71	77.92
H-2a	6.27	6.30
H-2b	18.69	18.97
D-1	1.57	2.65
D-2	6.46	20.64
Total	98.03	137.26

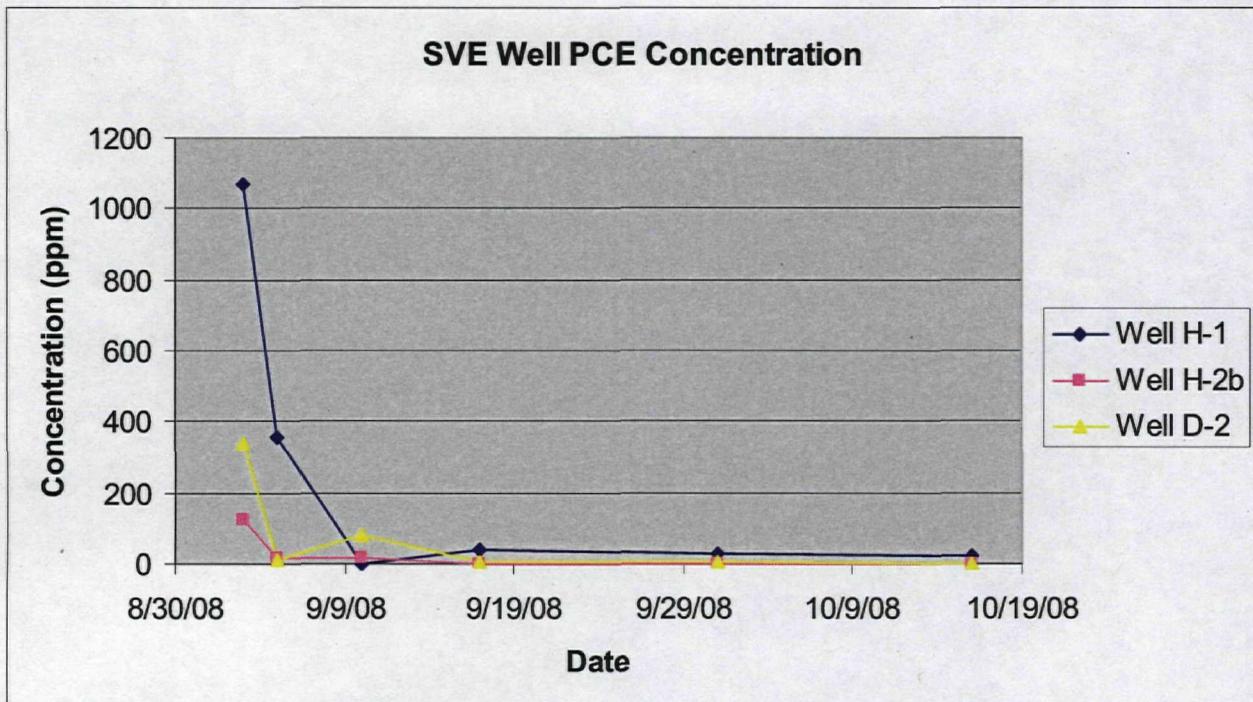

Approximately 3 months after shut down of the pilot test program, the individual systems were started back up, and sampled using TCE indicator tubes upon stabilization of operating parameters (approximately five minutes). The purpose of this supplemental assessment was to evaluate potential scenarios that could explain the rapid reduction in observed VOC concentrations observed during the first 5 days of operations. The two possible scenarios being evaluated were 1) small radius of influence in the clayey saprolite soils, and 2) low desorption rates of VOCs off of the subsurface soils. The working hypothesis for this evaluation was simply, if VOC concentrations rebounded to near the levels observed at startup, low desorption rates was the more likely explanation. If, however, the observed concentrations remained low, the most likely explanation would be a limited radius of influence.

Analytical results obtained from this evaluation were comparable to the results obtained prior to shutting down the pilot test. Evidence of rebound was not observed. Sampling results are summarized on Table 6.

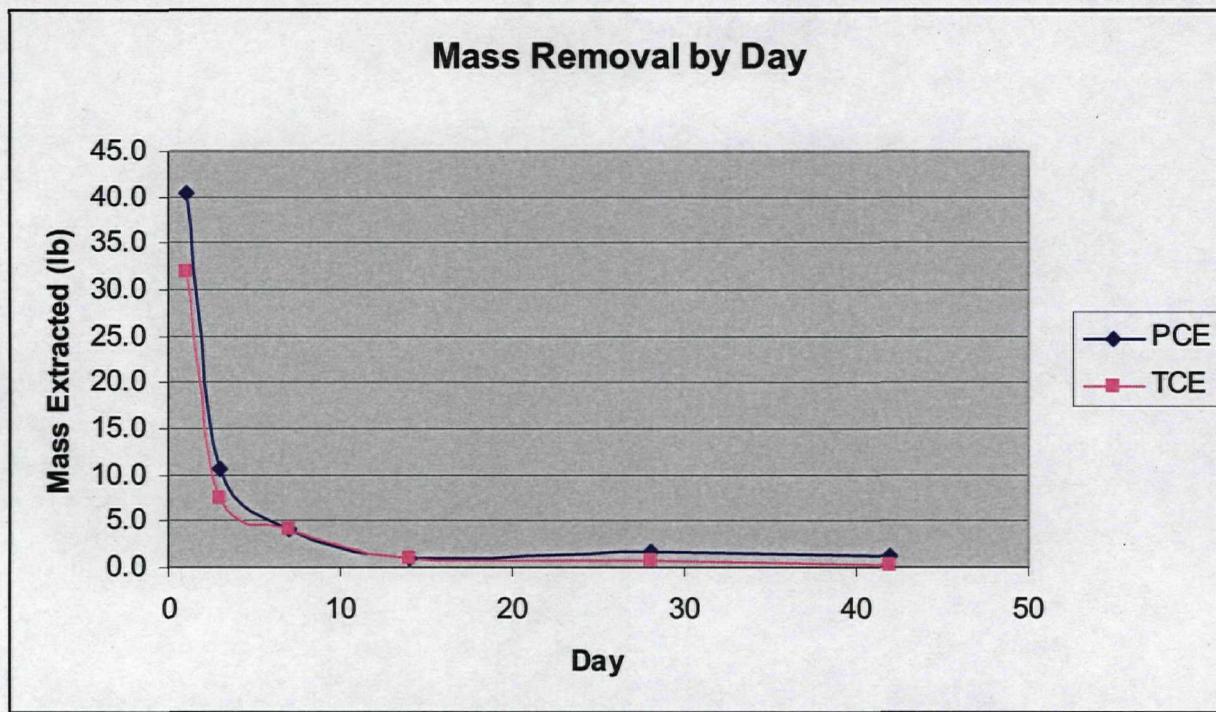

**Table 6**  
**TCE Indicator Tube Results from Post-Shutdown Sampling**

SVE WELL ID	FIRST ROUND OF SAMPLING WEEK OF 9/3/08	SIX WEEK SAMPLING WEEK OF 10/16/08	3-MONTH POST-SHUTDOWN SAMPLING 01/20/09

## **Section 7**

# **Conclusions/Recommendations**

---

RMT's analysis of the drilling logs, operating parameters, and analytical results has lead to the following conclusions and recommendations.

### **Conclusions**

- Visual observations of soil types and textural characteristics are consistent with operating parameters in that lower flow rates were recorded in the more clayey soil horizons.
- Two potential scenarios have been identified to explain the correlation between the high soil gas reading recorded during the Phase 1 and Phase 2 source delineation, the rapid decline in VOC concentration observed during the first five days of operation, and the absence of rebound following a three month shut-down period. These two scenarios are as follows:
  1. Extraction system effectively removed the residual source material contained in the pore spaces and adsorbed to the soil matrix within close proximity to the extraction wells, but the low permeability of the subsurface soils, combined with the modest vacuum pressures, restricted the area of influence.
  2. There is no residual source material adsorbed to the soil matrix. The soil gas readings recorded during the Phase 1 and Phase 2 source delineation represent a VOC halo, or vapor cloud emanating from the groundwater plume. The VOCs were quickly extracted from the subsurface and without additional mass adsorbed to the soil matrix, the concentrations quickly declined and did not recover.

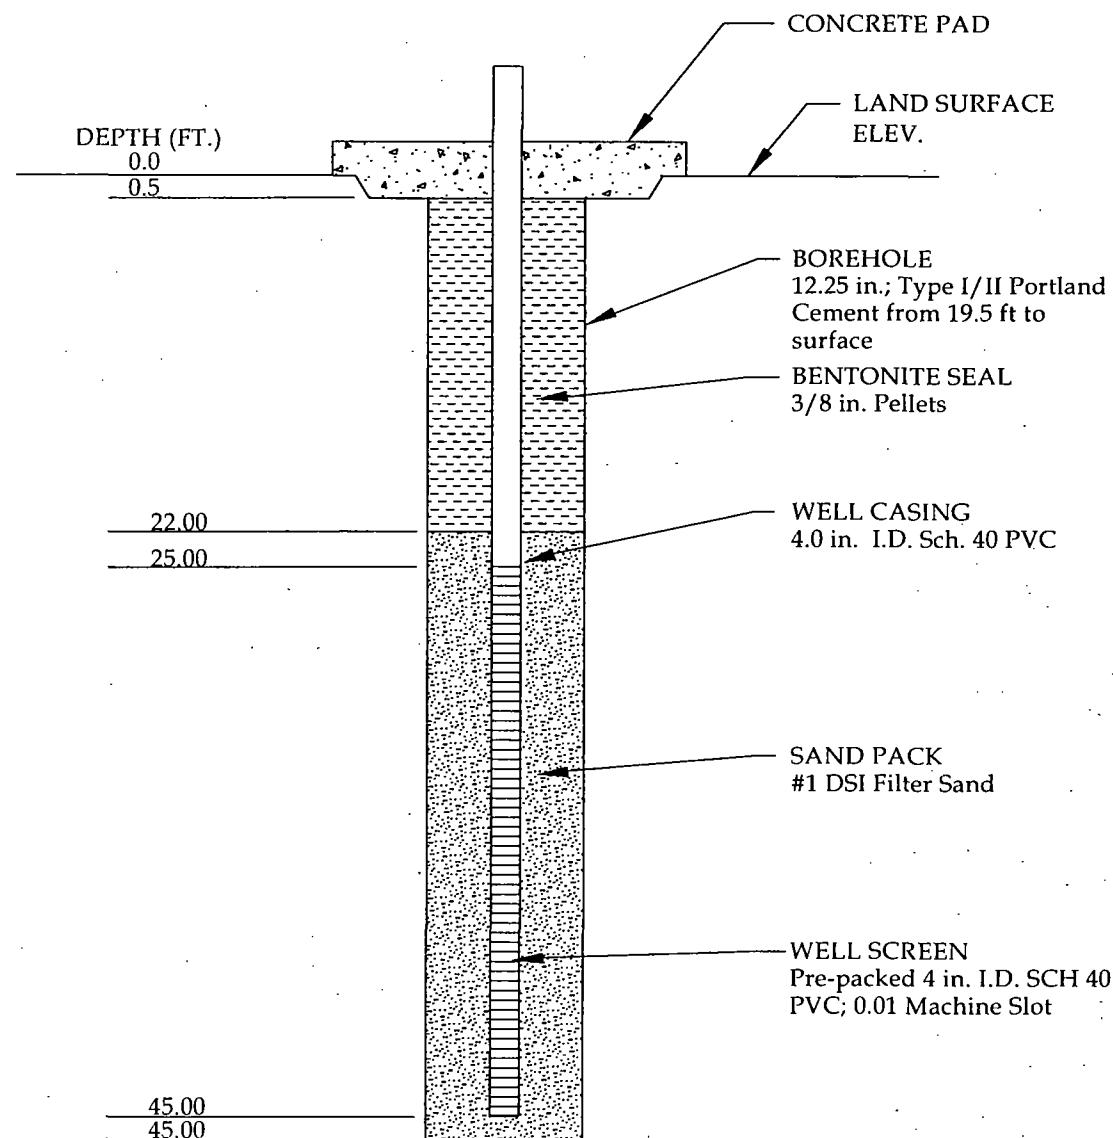

### **Recommendation**

- Based on the conclusions presented above, and taking into consideration the extent of the "hot spots" as determined from the Phase 1 and Phase 2 source delineation and the evidence of residual source material observed during drilling operations, RMT recommends further evaluation of the nature of the residual source and development of additional design parameters. Continuing to evaluate VOC mass removal, via SVE, in Area D and Area H, is appropriate.

### LITHOLOGIC DESCRIPTION

Sample Interval	% Recovery	Sample Type	Blow Counts	Depth (feet)	Stratigraphy	
				1		FINE SANDY SILT (MLS) - brownish red; dry; micaceous; some clay; color becomes more brown at 1 ft bgs
				2		FINE SANDY CLAYEY SILT (MLS) - brownish red; dry; micaceous with 2 cm pieces of mica; clayey silt forming pea-sized balls in a fine sandy silt matrix; material becoming harder and darker at 7 ft
				3		
				4		
				5		
				6		
				7		
				8		CLAYEY SILT (CL-ML) - reddish dark brown; dry; micaceous; cuttings resemble ground coffee
				9		
				10		
				11		
				12		SILT (ML) - dark brown; dry; micaceous; trace fine sand
				13		
				14		
				15		- as above; darker brown; dry; micaceous; cuttings are very hot, indicating the material is difficult to drill through
				16		
				17		
				18		MEDIUM SANDY SILT (SM) - dark brown; micaceous; hot cuttings
				19

## **Appendix C**

### **Blower Specifications**

---

**ROTRON Regenerative Blowers**

# EN 707 & CP 707 Three-Phase Sealed Regenerative Blower w/Explosion-Proof Motor

**FEATURES**

- Manufactured in the USA – ISO 9001 compliant
- Maximum flow: 295 SCFM
- Maximum pressure: 85 IWG
- Maximum vacuum: 87 IWG
- Standard motor: 5.0 HP, explosion-proof
- Cast aluminum blower housing, cover, impeller & manifold; cast iron flanges (threaded); teflon lip seal
- UL & CSA approved motor with permanently sealed ball bearings for explosive gas atmospheres Class I Group D minimum
- Sealed blower assembly
- Quiet operation within OSHA standards

**MOTOR OPTIONS**

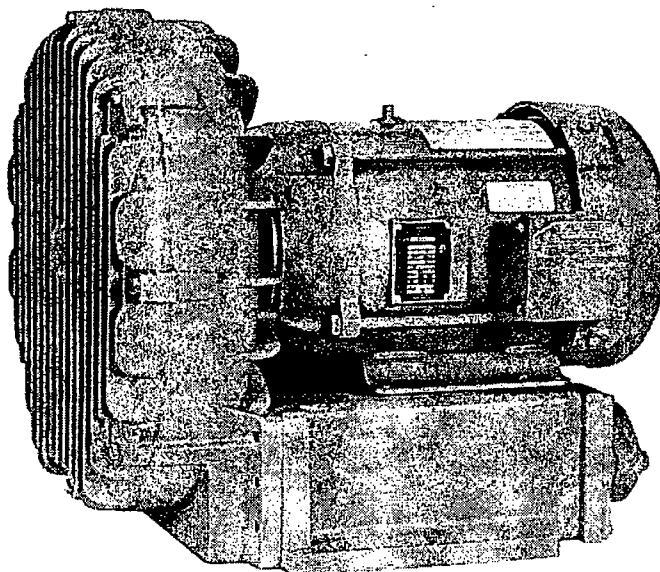

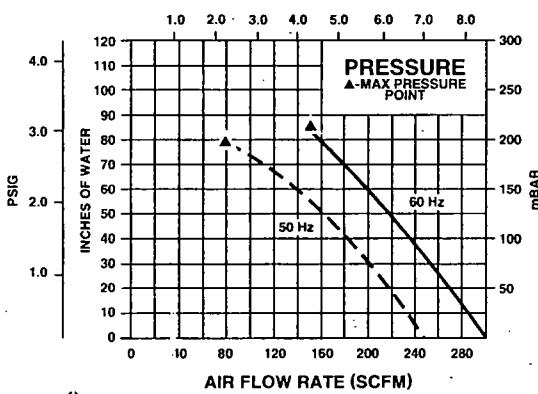

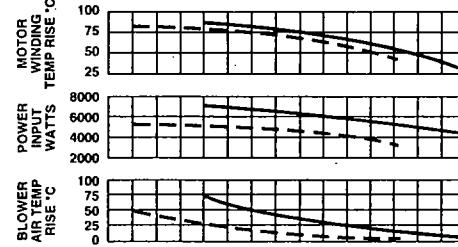

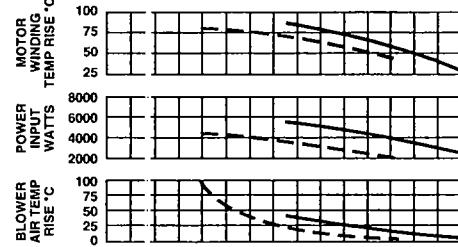

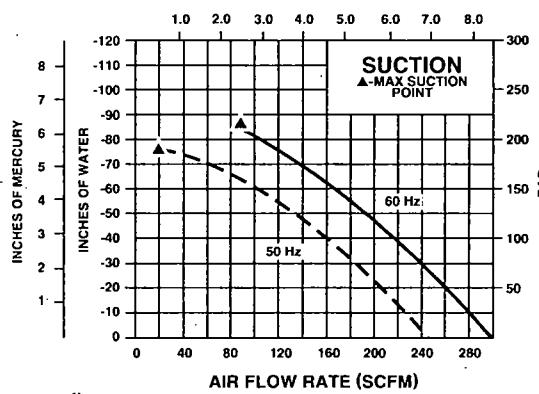

- International voltage & frequency (Hz)
- Chemical duty, high efficiency, inverter duty or industry-specific designs
- Various horsepower for application-specific needs

**BLOWER OPTIONS**

- Corrosion resistant surface treatments & sealing options
- Remote drive (motorless) models
- Slip-on or face flanges for application-specific needs

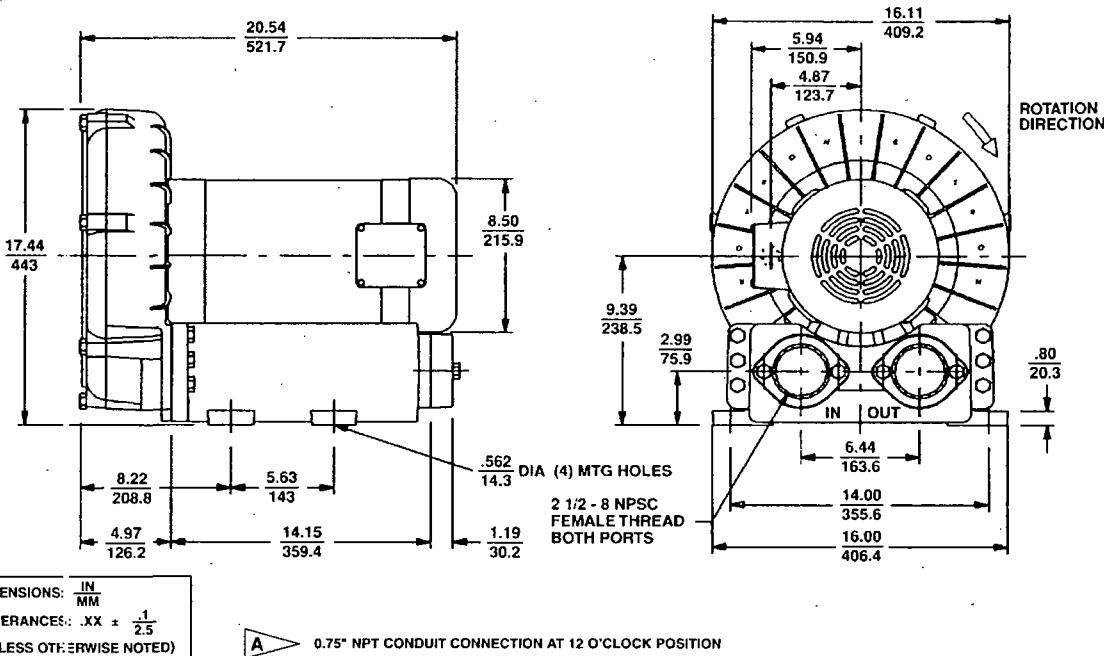

**ACCESSORIES** (See Catalog Accessory Section)

- Flowmeters reading in SCFM
- Filters & moisture separators
- Pressure gauges, vacuum gauges & relief valves
- Switches – air flow, pressure, vacuum or temperature
- External mufflers for additional silencing
- Air knives (used on blow-off applications)
- Variable frequency drive package

**BLOWER PERFORMANCE AT STANDARD CONDITIONS**AIR FLOW RATE (M<sup>3</sup>/MIN)AIR FLOW RATE (M<sup>3</sup>/MIN)

**ROTRON® Regenerative Blowers****EN 707 & CP 707 Three-Phase  
Sealed Regenerative Blower w/Explosion-Proof Motor**

Scale CAD drawing available upon request.

**SPECIFICATIONS**

MODEL	EN707F72MXL	EN707F86MXL	CP707FW72MXLR
Part No.	038710	038711	038974
Motor Enclosure – Shaft Material	Explosion-proof – CS	Explosion-proof – CS	Chem XP – SS
Horsepower	5.0	5.0	Same as EN707F72MXL – 038710
Phase – Frequency <sup>1</sup>	Three - 60 Hz	Three - 60 Hz	except add Chemical Processing (CP) features from catalog inside front cover
Voltage <sup>1</sup>	230	460	
Motor Nameplate Amps	14	7	
Max. Blower Amps <sup>3</sup>	15	7.5	
Inrush Amps	152	76	
Starter Size	1	0	
Service Factor	1.0	1.0	
Thermal Protection <sup>2</sup>	Class B - Pilot Duty	Class B - Pilot Duty	
XP Motor Class – Group	I-D, II-F&G	I-D, II-F&G	
Shipping Weight	174 lb (79 kg)	174 lb (79 kg)	

<sup>1</sup> Rotron motors are designed to handle a broad range of world voltages and power supply variations. Our dual voltage 3 phase motors are factory tested and certified to operate on both: 208-230/415-460 VAC-3 ph-60 Hz and 190-208/380-415 VAC-3 ph-50 Hz. Our dual voltage 1 phase motors are factory tested and certified to operate on both: 104-115/208-230 VAC-1 ph-60 Hz and 100-110/200-220 VAC-1 ph-50 Hz. All voltages above can handle a ±10% voltage fluctuation. Special wound motors can be ordered for voltages outside our certified range.

<sup>2</sup> Maximum operating temperature: Motor winding temperature (winding rise plus ambient) should not exceed 140°C for Class F rated motors or 120°C for Class B rated motors. Blower outlet air temperature should not exceed 140°C (air temperature rise plus inlet temperature). Performance curve maximum pressure and suction points are based on a 40°C inlet and ambient temperature. Consult factory for inlet or ambient temperatures above 40°C.

<sup>3</sup> Maximum blower amps corresponds to the performance point at which the motor or blower temperature rise with a 40°C inlet and/or ambient temperature reaches the maximum operating temperature.

Specifications subject to change without notice. Please consult your Local Field Sales Engineer for specification updates.

**ROTRON® Regenerative Blowers**

# EN 808 & CP 808 Three-Phase Sealed Regenerative Blower w/Explosion-Proof Motor

**FEATURES**

- Manufactured in the USA – ISO 9001 compliant
- Maximum flow: 350 SCFM
- Maximum pressure: 90 IWG
- Maximum vacuum: 97 IWG
- Standard motor: 7.5 HP, explosion-proof
- Cast aluminum blower housing, cover, impeller & manifold; cast iron flanges (threaded); teflon lip seal
- UL & CSA approved motor with permanently sealed ball bearings for explosive gas atmospheres Class I Group D minimum
- Sealed blower assembly
- Quiet operation within OSHA standards

**MOTOR OPTIONS**

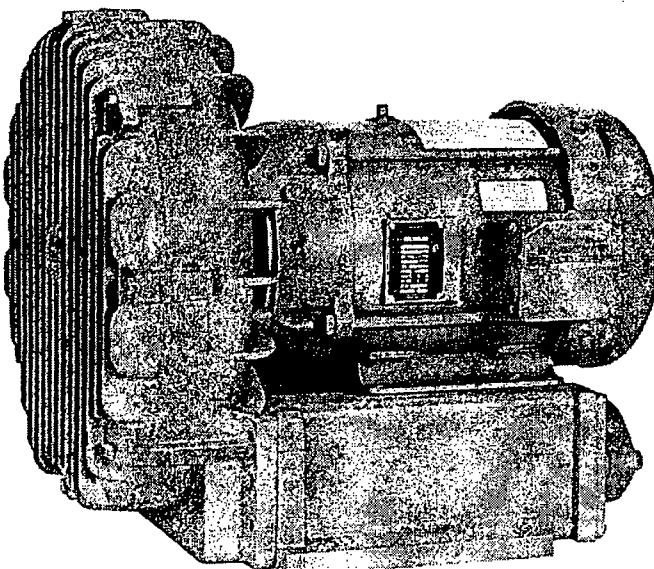

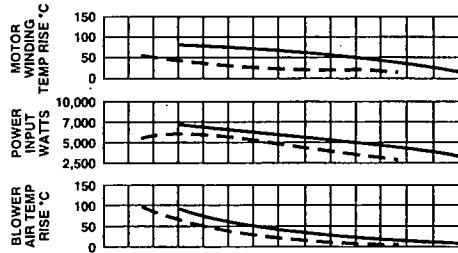

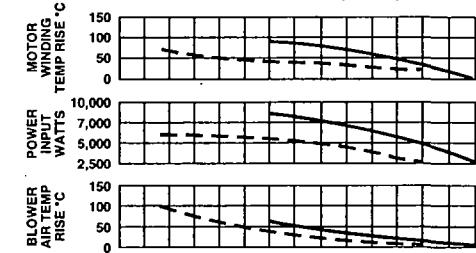

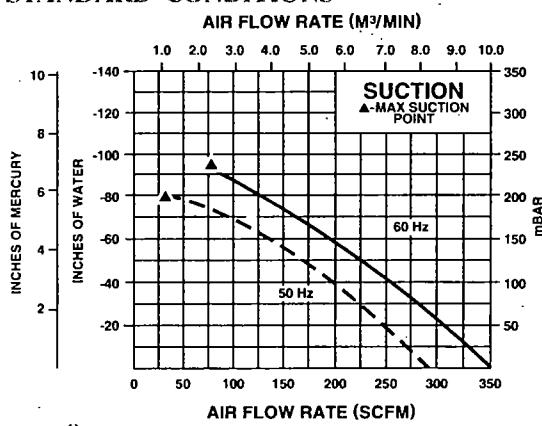

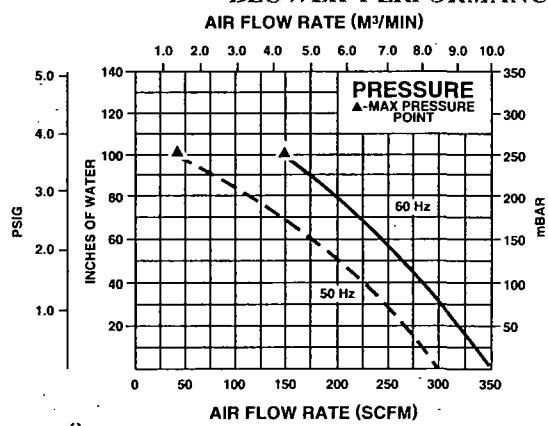

- International voltage & frequency (Hz)
- Chemical duty, high efficiency, inverter duty or industry-specific designs
- Various horsepower for application-specific needs

**BLOWER OPTIONS**

- Corrosion resistant surface treatments & sealing options
- Remote drive (motorless) models
- Slip-on or face flanges for application-specific needs

**ACCESSORIES** (See Catalog Accessory Section)

- Flowmeters reading in SCFM
- Filters & moisture separators
- Pressure gauges, vacuum gauges & relief valves
- Switches – air flow, pressure, vacuum or temperature
- External mufflers for additional silencing
- Air knives (used on blow-off applications)
- Variable frequency drive package

**BLOWER PERFORMANCE AT STANDARD CONDITIONS**

Mr. Robert VandenMeiracker  
RMT, Inc.  
30 Patewood Drive, Suite 100  
Greenville, SC 29615

RE: Construction Permit Exemption for Additional SVE Units on Sangamo/Weston Superfund Site  
(Permit No. 1880-0056)

Dear Mr. VandenMeiracker:

The Bureau of Air Quality has received your request, dated August 21, 2008, for a construction permit exemption for two new extraction wells at Area D, and three new skid mounted SVE units connected to extraction wells in the Former Pant Area and Area H to remove chlorinated VOCs from the soil. This project is scheduled to take approximately 6-weeks, and the Bureau will be notified if RMT shall need more time.

Based on the information above and that contained in your letter, the Bureau exempts the additional SVE Units. This change is exempted in accordance with the following regulations:

- SC Regulation 61-62.1, Section II(B)(2)(h), because it has been determined that the alteration will have a total uncontrolled emission rate of less than 1000 lbs/month of VOC.

Although the project is exempt from permitting, it is still subject to all applicable SC Air Pollution Control Regulations and Standards (SC Regulations 61-62). Should any of the information concerning this project be found in error/superseded, be determined, a new review shall be required. Any alterations or deviations must have prior approval before being implemented. If you should have any questions, please call me at (803) 898-4108 or email me at [trowhijj@dhec.sc.gov](mailto:trowhijj@dhec.sc.gov).

Sincerely,

*Janelle J. Trowhill*

# ANALYTICAL ENVIRONMENTAL SERVICES, INC.

September 11, 2008

Travis Tarbet  
RMT  
30 Patewood Dr.  
Suite 100 Patewood Plaza One  
Greenville, SC 29615-3535

TEL: (864) 281-0030  
FAX (864) 281-0288

RE: Sangamo SVE

Order No.: 0809404

Dear Travis Tarbet:

Analytical Environmental Services, Inc. received 7 samples on 9/6/2008 10:50:00 AM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.

AES' certifications are as follows:

- NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/08-06/30/09.
- AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 08/01/09.

These results relate only to the items tested. This report may only be reproduced in full and contains 9 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

Chantelle Kanhai  
Project Manager

RE: Sangamo SUE

Order No.: 0809405

Dear Travis Tarbet:

Analytical Environmental Services, Inc. received 5 samples on 9/6/2008 10:50:00 AM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.

AES' certifications are as follows:

- NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/08-06/30/09.
- AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 08/01/09.

These results relate only to the items tested. This report may only be reproduced in full and contains 8 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

Chantelle Kanhai  
Project Manager

RE: Schlumberger

Dear Travis Tarbet:

Order No.: 0809851

Analytical Environmental Services, Inc. received 9 samples on 9/11/2008 9:15:00 AM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.

AES' certifications are as follows:

- NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/08-06/30/09.
- AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 08/01/09.

These results relate only to the items tested. This report may only be reproduced in full and contains 9 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

*for*  
Chantelle Kanhai  
Project Manager

RE: Sangamo-SVE

Order No.: 0809D55

Dear Travis Tarbet:

Analytical Environmental Services, Inc. received 9 samples on 9/19/2008 9:25:00 AM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.

AES' certifications are as follows:

-NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/08-06/30/09.  
-AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 08/01/09.

These results relate only to the items tested. This report may only be reproduced in full and contains 8 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

*Ein R. Ruoff*

for

Chantelle Kanhai  
Project Manager

RE: Sangamo - SVE

Order No.: 0809G61

Dear Travis Tarbet:

Analytical Environmental Services, Inc. received 4 samples on 9/24/2008 9:35:00 AM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.

AES' certifications are as follows:

- NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/08-06/30/09.
- AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 08/01/09.

These results relate only to the items tested. This report may only be reproduced in full and contains 7 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

*Eri N. Rupp*

for Chantelle Kanhai  
Project Manager

**Wisconsin State Laboratory of Hygiene****University of Wisconsin**

Displayed values on report have been rounded; however all calculations are performed using raw, unrounded intermediate results. Please contact the laboratory if you have any questions regarding our result calculation or rounding. All samples were received by the laboratory in acceptable condition unless otherwise noted.

< : Less Than. The analyte, if present, is at a level too low to be accurately quantitated by the method used. The actual amount is less than the reported value.

## Analytical Methodology

**GENERAL SOLVENTS:**

These samples are analyzed using WOHL method WG006.5, which is based on the method, OSHA 7.

The collection media is a SMALL (SCT) (SKC 226-01), LARGE (LCT) (SKC 226-09), JUMBO (JCT) (226-16) or JUMBO<sup>2</sup> (226-16-02) Activated Charcoal tube.

Front and back sections of the tube are separately desorbed in 1 ml for SMALL tubes, 3 ml for LARGE tubes, 5 ml for JUMBO tubes, or 10 ml for JUMBO<sup>2</sup> tubes of Carbon Disulfide for 30 minutes prior to analysis.

The samples are run on a Hewlett-Packard Gas Chromatograph equipped with an FID. The Primary and Confirming columns were chosen from the following:

Carbopack C /0.1% SP-1000

VoCol 105M Capillary

HP-5 Capillary

Supelcowax-10 Capillary

SPB-624 capillary

Samples may also have been confirmed on a Model 5972 Hewlett-Packard Gas Chromatograph Mass-Selective Detector containing a Nukol Capillary.

Reporting Limits are specific for each substance.

Results may be blank corrected for known solvent/media contamination.

**REPORTING LIMITS:**

This table contains the WOHL determined reporting limits for the compounds specified in this report. These numbers are based on the historical statistical data for a particular analyte or are based on WOHL determined values.

<u>Analyte</u>	<u>Reporting Limit</u>
Dichloroethylene (1,2-) on JCT	13 µg/sample
Naphtha (Coal Tar) on JCT	9 µg/sample
Perchloroethylene on JCT	16 µg/sample
Petroleum Distillates on JCT	6.5 µg/sample
Toluene on JCT	8.5 µg/sample
Trichloroethylene on JCT	14.5 µg/sample

Wisconsin State Laboratory of Hygiene

University of Wisconsin

## Analytical Quality Control

Laboratory prepared quality control (QC) samples were analyzed along with the samples included in the analytical report. The analysis results for these QC samples are listed below.

Instrument Used for Analysis: Gas Chromatograph with FID

### Laboratory Control Sample: 134281

QC Sample Media: SCT lot 2000 charcoal

<u>Analyte</u>	<u>Target Value</u>	<u>Recovery (%)</u>	<u>Acceptable Recovery (%)</u>	<u>Pass/Fail</u>
Toluene	867 µg/sample	98.4	88 - 112	PASS

### Laboratory Control Sample: 134282

QC Sample Media: SCT lot 2000 charcoal

<u>Analyte</u>	<u>Target Value</u>	<u>Recovery (%)</u>	<u>Acceptable Recovery (%)</u>	<u>Pass/Fail</u>
Toluene	2601 µg/sample	99.8	88 - 112	PASS

The acceptable range for an analyte is based on the standard deviation of each analyte, which has been determined from statistical evaluation of the historical performance of the assay. The acceptable range includes up to 3 standard deviations, so a result within 3 standard deviations is considered to have passed the QC requirements. A result outside of the acceptable range is considered to have failed QC and may indicate the direction of possible bias for the samples included in the analytical report. The analytes used for QC determination will not always be the same analytes that appear in the samples for the report, however they are representative of the compounds found in the samples and indicative of overall assay performance.

## End of Analytical Report

The results in this report apply only to the samples, specifically listed above, tested at the Wisconsin Occupational Health Laboratory.  
This report is not to be reproduced except in full.

RE: Sangamo SVE

Dear Travis Tarbet:

Order No.: 0810282

Analytical Environmental Services, Inc. received 5 samples on 10/3/2008 9:15:00 AM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.

AES' certifications are as follows:

- NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/08-06/30/09.
- AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 08/01/09.

These results relate only to the items tested. This report may only be reproduced in full and contains 8 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

Chantelle Kanhai  
Project Manager

RE: Sangamo SVE

Order No.: 0810C85

Dear Travis Tarbet:

Analytical Environmental Services, Inc. received 5 samples on 10/17/2008 10:40:00 AM for the analyses presented in the following report.

No problems were encountered during the analyses. Additionally, all results for the associated Quality Control samples were within EPA and/or AES established limits. Any discrepancies associated with the analyses contained herein will be noted and submitted in the form of a project Case Narrative.

AES' certifications are as follows:

- NELAC/Florida Certification number E87582 for analysis of Environmental Water, soil/hazardous waste, and Drinking Water Microbiology, effective 07/01/08-06/30/09.
- AIHA Certification ID #100671 for Industrial Hygiene samples (Organics, Inorganics), Environmental Lead (Paint, Soil, Dust Wipes, Air), and Environmental Microbiology (Fungal) effective until 08/01/09.

These results relate only to the items tested. This report may only be reproduced in full and contains 7 total pages (including cover letter).

If you have any questions regarding these test results, please feel free to call.

Sincerely,

Chantelle Kanhai  
Project Manager

## Sample/Cooler Receipt Checklist

Client RMT

Work Order Number 0809411

Checklist completed by Bret Ayd Date 9-9-8

Carrier name: FedEx   UPS   Courier   Client   US Mail   Other DHL

Shipping container/coolers in good condition? Yes  No  Not Present

Custody seals intact on shipping container/coolers? Yes  No  Not Present

Custody seals intact on sample bottles? Yes  No  Not Present

Container/Temp Blank temperature in compliance? <sup>ca 9/9/8</sup> ~~(4°C±2)\*~~ Yes  No

Cooler #1 Ambient Cooler #2   Cooler #3   Cooler #4   Cooler #5   Cooler #6  

Chain of custody present? Yes  No

Chain of custody signed when relinquished and received? Yes  No

Chain of custody agrees with sample labels? Yes  No

Samples in proper container/bottle? Yes  No

Sample containers intact? Yes  No

Sufficient sample volume for indicated test? Yes  No

All samples received within holding time? Yes  No

Was TAT marked on the COC? Yes  No

Proceed with Standard TAT as per project history? Yes  No  Not Applicable

Water - VOA vials have zero headspace? No VOA vials submitted  Yes  No

Water - pH acceptable upon receipt? Yes  No  Not Applicable

Adjusted? \_\_\_\_\_ Checked by \_\_\_\_\_

Sample Condition: Good  Other(Explain) \_\_\_\_\_

(For diffusive samples or AIHA lead) Is a known blank included? Yes  No

See Case Narrative for resolution of the Non-Conformance.

\* Samples do not have to comply with the given range for certain parameters.

**Analytical Environmental Services, Inc.**

Date: 11-Sep-08

**CLIENT:** RMT  
**Project:** Schlumberger  
**Lab Order:** 0809411

**CASE NARRATIVE**

Volatile Organic Analysis by Method N1003:

Due to the amount of charcoal provided by the client, samples 0809411-001, -002, -003, -004, -005, and -006 required additional solvent during preparation resulting in elevated reporting limits.

**Analytical Results  
for  
RMT**

**WorkOrder:** 0809411

**Client Reference:** Schlumberger

**Wisconsin State Laboratory of Hygiene**

**University of Wisconsin**

Displayed values on report have been rounded; however all calculations are performed using raw, unrounded intermediate results.  
Please contact the laboratory if you have any questions regarding our result calculation or rounding. All samples were received by the laboratory in acceptable condition unless otherwise noted.

<: Less Than. The analyte, if present, is at a level too low to be accurately quantitated by the method used.  
The actual amount is less than the reported value.

## Analytical Methodology

**GENERAL SOLVENTS:**

These samples are analyzed using WOHL method WG006.5, which is based on the method, OSHA 7.

The collection media is a SMALL (SCT) (SKC 226-01), LARGE (LCT) (SKC 226-09), JUMBO (JCT) (226-16) or JUMBO2 (226-16-02) Activated Charcoal tube.

Front and back sections of the tube are separately desorbed in 1 ml for SMALL tubes, 3 ml for LARGE tubes, .5 ml for JUMBO tubes, or 10 ml for JUMBO2 tubes of Carbon Disulfide for 30 minutes prior to analysis.

The samples are run on a Hewlett-Packard Gas Chromatograph equipped with an FID. The Primary and Confirming columns were chosen from the following:

Carbopack C /0.1% SP-1000  
VoCol 105M Capillary  
HP-5 Capillary  
Supelcowax-10 Capillary  
SPB-624 capillary

Samples may also have been confirmed on a Model 5972 Hewlett-Packard Gas Chromatograph Mass-Selective Detector containing a Nukol Capillary.

Reporting Limits are specific for each substance.

Results may be blank corrected for known solvent/media contamination.

**REPORTING LIMITS:**

This table contains the WOHL determined reporting limits for the compounds specified in this report. These numbers are based on the historical statistical data for a particular analyte or are based on WOHL determined values.

<u>Analyte</u>	<u>Reporting Limit</u>
Chlorobenzene (Mono) on JCT	18 µg/sample
Dichloroethylene (1,2-) on JCT	13 µg/sample
Naphtha (Coal Tar) on JCT	9 µg/sample
Perchloroethylene on JCT	16 µg/sample
Petroleum Distillates on JCT	6.5 µg/sample
Toluene on JCT	8.5 µg/sample
Trichloroethylene on JCT	14.5 µg/sample

## Analytical Quality Control

Laboratory prepared quality control (QC) samples were analyzed along with the samples included in the analytical report. The analysis results for these QC samples are listed below.

Instrument Used for Analysis: Gas Chromatograph with FID

### Laboratory Control Sample: 134283

QC Sample Media: SCT lot 2000 charcoal

<u>Analyte</u>	<u>Target Value</u>	<u>Recovery (%)</u>	<u>Acceptable Recovery (%)</u>	<u>Pass/Fail</u>
Toluene	1734 µg/sample	95.9	88 - 112	PASS

### Laboratory Control Sample: 134284

QC Sample Media: SCT lot 2000 charcoal

<u>Analyte</u>	<u>Target Value</u>	<u>Recovery (%)</u>	<u>Acceptable Recovery (%)</u>	<u>Pass/Fail</u>
Toluene	3468 µg/sample	95.8	88 - 112	PASS

The acceptable range for an analyte is based on the standard deviation of each analyte, which has been determined from statistical evaluation of the historical performance of the assay. The acceptable range includes up to 3 standard deviations, so a result within 3 standard deviations is considered to have passed the QC requirements. A result outside of the acceptable range is considered to have failed QC and may indicate the direction of possible bias for the samples included in the analytical report. The analytes used for QC determination will not always be the same analytes that appear in the samples for the report, however they are representative of the compounds found in the samples and indicative of overall assay performance.

## End of Analytical Report

The results in this report apply only to the samples, specifically listed above, tested at the Wisconsin Occupational Health Laboratory.  
This report is not to be reproduced except in full.

\*A DISC indicator means that your analysis price has been adjusted based on a negotiated discount with the laboratory.

**THIS IS NOT A BILL. DO NOT PAY THIS AMOUNT AT THIS TIME!**

This is a statement of work performed on the samples and results contained in this report only and does not include charges for special additional analyses requested, media charges, shipping charges or equipment rental. Charges for samples and tests not listed above will appear on a future statement once those tests have been reported.

This summary is supplied as a convenience to our customers at the time they receive their report. The actual invoice for the work performed will be mailed shortly and you will have 30 days from that invoice date to make your payment.

If you have any questions regarding the information on this statement please contact the laboratory at 1-800-446-0403.
