PILOT TEST RESULTS FOR ION EXCHANGE RESIN AND GRANULAR ACTIVATED CARBON TO TREAT GROUNDWATER IMPACTED WITH PER- AND POLYFLUOROALKYL SUBSTANCES LA HABRA HEIGHTS COUNTY WATER DISTRICT – WATER SUPPLY WELL #10

EXECUTIVE SUMMARY

In an effort to meet anticipated drinking water regulations for per- and polyfluoroalkyl substances (PFAS), Water Replenishment District of Southern California (WRD) retained GSI Environmental Inc. to conduct pilot testing to evaluate the performance and life cycle costs for ion exchange (IX) and granular activated carbon (GAC) to treat groundwater impacted by PFAS including perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS). GSI's team also includes technical support provided by Hazen and Sawyer and AqueoUS Vets (AV).

The pilot-scale study involved testing the ability of eight types of adsorbent media (four IX resins and four GACs) to remove PFAS from water sourced from La Habra Heights County Water District (LHHCWD) Water Supply Well #10. The site was selected to be representative of typical PFAS concentrations for WRD wells with PFOA concentrations that exceed the current 10 nanograms per liter (ng/L) response level (RL). The results of the 12-month pilot test, were then used to develop 20-year life cycle costs that could be used by WRD well pumpers to select a suitable PFAS treatment media. The pilot skid was built by AqueoUS Vets in collaboration with the GSI Team, who operated the skid during the duration of the test. Empty bed contact time (EBCT) of the GAC test columns were selected to match a typical full-scale GAC EBCT (10 minutes), while a shorter EBCT (1.2 minutes) was selected for IX resin due to concerns over testing duration. The pilot skid was monitored daily, and flowrates were adjusted periodically to correspond with the design pilot test EBCTs of the GAC and IX media. Influent water was pretreated with a 5-micron cartridge filter to prevent fouling. While the pilot skid generally operated effectively over the pilot test duration, periodic well shutdowns and insufficient well supply pressure caused periods of down time throughout the test.

Of the three PFAS with California drinking water RLs, PFOA was consistently observed to be the driver for media changeout. Because the effluent samples for all GACs did not have detectable concentrations of PFOA until the end of the test, linear extrapolation of midpoint breakthrough curves was used to estimate the 10 ng/L PFOA breakthrough times and bed volumes. Of the GACs tested, F400 is anticipated to treat the most water prior to breakthrough at the 10 ng/L RL for PFOA. Of the four tested IX resins, only PFA694E had broken through with respect to the PFOA RL by the end of the test. The same linear extrapolation approach that was applied to the GACs was applied to the three other IX media effluent breakthrough curves to estimate the 10 ng/L PFOA breakthrough bed volumes. Based on the results, PSR2 Plus was determined to be the best performing IX resin.

The overall cost-effectiveness of all tested media was evaluated using life cycle cost analysis that involved the development of cash flows to represent capital and operation and maintenance (O&M) costs. These cash flows were converted to net present value (NPV) for ease of comparison between alternatives. Key assumptions were made to simplify the cost estimation process including a 20-year operational life, lead-lag treatment vessel configuration, exclusion of costs that were equal among alternatives, landfill disposal of spent IX resin, and manufacturers' regeneration of spent GAC. Based on the sensitivity analysis, all media life cycle costs were found to generally have the same level of sensitivity to uncertainty in bed life estimates. Using this approach, the AV1240LDX GAC was found to be the most cost-effective media for removing PFAS from LHHCWD Well #10 with a net present value cost of $2,920,000, with the PRS2 Plus being a close second at an NPV of $2,996,000 (a cost difference of $76,000).

PILOT TEST RESULTS FOR ION EXCHANGE RESIN AND GRANULAR ACTIVATED CARBON TO TREAT GROUNDWATER IMPACTED WITH PER- AND POLYFLUOROALKYL SUBSTANCES LA HABRA HEIGHTS COUNTY WATER DISTRICT – WATER SUPPLY WELL #10

1.0 INTRODUCTION

On behalf of the Water Replenishment District of Southern California (WRD), GSI Environmental Inc. (GSI) has prepared this report to present the pilot test results for ion exchange (IX) resin and granular activated carbon (GAC) to treat groundwater impacted with per- and polyfluoroalkyl substances (PFAS). GSI's team also includes technical support provided by Hazen and Sawyer and AqueoUS Vets (AV).

1.1 Report Organization

This report is organized as follows:

- Section 1 – Introduction
- Section 2 – Pilot Test Design
- Section 3 – Sampling and Analysis
- Section 4 – Results
- Section 5 – Data Evaluation and Discussion
- Section 6 – Life cycle Cost Analyses
- Section 7 – Conclusions
- Section 8 – References

1.2 Background

PFAS are a group of man-made chemicals that include perfluorooctanoic acid (PFOA), perfluorooctanesulfonic acid (PFOS), and many other chemicals. PFAS have been manufactured and used in a variety of industries since the 1940s, and PFOA and PFOS have been the most extensively produced and studied of PFAS. Both chemicals are persistent in the environment and in the human body and exposure to unsafe levels of PFOA/PFOS may result in adverse health effects (USEPA, 2017).

PFOA and PFOS do not currently have maximum contaminant levels (MCLs) in California or at the federal level; however, California State Water Resources Control Board, Division of Drinking Water (DDW) has set notification levels (NLs) and response levels (RLs) for both contaminants. When the concentrations of PFAS exceed their respective NLs in drinking water, the public water system which supplies water directly to the end user must notify the public water system's governing body and the governing body of any local agency whose jurisdiction includes areas supplied with drinking water by the water system. A local agency means a city or county. If the water system is a water company regulated by the California Public Utilities Commission ("Commission"), then the water system must also notify the Commission. When drinking water from a drinking water source with PFAS concentrations exceeding the RLs, the water system may choose to either take a water source out of use, treat the water delivered, or provide public notification as outlined in Health and Safety Code section 116378.

DDW has issued the following recent updates to the NLs and RLs for PFAS:

- In August 2019, the DDW issued updated drinking water NLs of 5.1 and 6.5 nanograms per liter (ng/L), or parts per trillion, for PFOA and PFOS, respectively;
- On February 6, 2020, DDW issued updated drinking water RLs of 10 ng/L for PFOA and 40 ng/L for PFOS; and
- On March 5, 2021, DDW issued drinking water NL and RL of 500 and 5,000 ng/L, respectively, for perfluorobutane sulfonic acid (PFBS).

In addition, Health and Safety Code section 116378, subdivision (c)(1) states that if monitoring results in a PFAS detection that is either left unconfirmed or is confirmed by one to two additional samples, then a community water system or a nontransient-noncommunity water system must report that detection in the annual consumer confidence report.

WRD commissioned the pilot test described in this report to assess the effectiveness and efficiency of several GAC and IX products on the La Habra Heights County Water District Water Supply Well #10 water and to develop typical life cycle costs for treatment of the pumped groundwater using these two types of treatment media (GAC and IX) to meet the RLs for PFOA and PFOS. The pilot test was conducted in general accordance with a work plan entitled "Work Plan for Ion Exchange and Granular Activated Carbon Pilot Tests to Treat Groundwater Impacted with Per- and Poly-fluoroalkyl Substances" dated April 10, 2020 (GSI, 2020). It is intended that the data produced in this report will inform future permitting efforts with the DDW.

1.3 Pilot Test Objectives

The objectives for this pilot test were:

1. To evaluate the efficiency and effectiveness of four different types of GAC and four different types of IX resin for PFAS removal. To assess the PFAS breakthrough through these media as well as each media's ability to remove PFAS compounds to below the RLs.
2. To compare the IX treatment results with the vendors' predictive models to demonstrate the utility of these models for planning effective water treatment.
3. To estimate water treatment life cycle costs, including both capital and operation and maintenance (O&M) costs for select type of GAC and IX resin.
4. To provide a recommendation as to the most effective treatment option for Water Supply Well #10.

2.0 PILOT TEST DESIGN

This section addresses the selection of the pilot test well, the media selection process, and the pilot test design. A description of the criteria that were considered during test well selection is presented in Section 2.1. The treatment media selected for testing are described in Section 2.2. The GSI team coordinated with AqueoUS Vets to design the test skid as described in Section 2.3.

2.1 Pilot Study Well Site Selection

Multiple groundwater production wells were considered to provide the source water for the pilot tests. Ultimately, the following two sites were selected:

- SITE #1 - Montebello Land & Water Company Water Supply Well #7 (MTBLW Well #7)
- SITE #2 - La Habra Heights County Water District Water Supply Well #10 (LHHCWD Well #10)

The well sites are shown on **Figure 1**. This report presents the pilot test results of LHHCWD Well #10 (shown on **Figure 2**). The results of MTBLW #7 are presented in a separate report (GSI, 2021). LHHCWD Well #10 was selected because:

- The PFOA and PFOS concentrations exceeded the DDW RLs.
- The well was located near the San Gabriel spreading grounds where surface water is percolated into the ground, replenishing the underlying aquifer. These spreading grounds represent a separate groundwater recharge source from the source water feeding another WRD pilot test conducted in Montebello (Rio Hondo River).
- The well could be operated continuously for a long period with minimal shutdown.
- There was adequate space and security at the well location to support the pilot test skid.
- The LHHCWD staff could provide day-to-day pilot test technical observations and support.
- The well sulfate concentrations were sufficient such that PFAS breakthrough time for the IX media was expected to be shortened. The presence of elevated concentrations of sulfate may reduce the IX bed life, depending on the resin and its selectivity for sulfate (i.e., sulfate may take up some of the adsorption capacity on the resin surface and decrease the space available for PFAS). This expected reduction in test duration would be helpful, given the limited time available to compete the pilot testing.

The LHHCWD and WRD provided the following facility and well details to the GSI team prior to pilot test implementation to aid in the design of the treatment skids and the calculation of projected pilot test duration:

Site Location:	Intersection of Saragosa St. and Norwalk Blvd., Whittier, California (located near the San Gabriel River spreading grounds).
Pumping Rate:	2,200 to 2,400 gallons per minute (gpm)
Discharge pressure:	8 to 20 pounds per square inch (psi)
Notable Water Constituent Concentrations:	PFOA – 11 to 15 ng/L PFOS – 30 to 50 ng/L Sulfate – 130 to 180 milligrams per liter (mg/L) Total organic carbon (TOC) – approximately 0.6 mg/L
Other Considerations:	Treated water from the pilot testing could be discharged through an existing discharge under the facility's National Pollution Discharge Elimination System permit

2.2 Media Evaluated During Pilot Tests

Four unique GAC products and four unique IX resins were used for the pilot test. The process used to select these products for testing is presented in this section. The manufacturers' specifications for these products are included in **Appendix A**.

2.2.1 GAC Selection Process

The four selected GAC products were bituminous coal-based carbon products. Based on the previous GAC pilot studies using different types of carbon published in American Water Works Association Journal in January 2018 (McNamara et al., 2018), coal-based carbon resulted in markedly better PFAS removal than coconut shell-based carbon; therefore, the coconut shell-based carbon was not used for this testing. The GAC products selected were:

Provider	Product Name	Description
AqueoUS Vets®	AV 1240 Coal Base (AV1240CB)	Direct activated virgin bituminous coal carbon
AqueoUS Vets®	AV 1240 LDX (AV1240LDX)	Direct activated low-density virgin bituminous coal carbon
AqueoUS Vets®	AV 1240 PFAS (AV1240PFAS)	Proprietary carbon
Calgon Carbon	Filtrasorb® 400 (F400)	Reagglomerated virgin bituminous coal carbon

As shown in the GAC summary table above, there are two different coal processing methods used in the manufacture of GAC: direct activation and reagglomeration. Direct activated carbon is produced when the source carbon material (in this case coal) is pyrolyzed at high temperatures, typically in an inert atmosphere. Alternatively, this can be accomplished by exposure to oxygen or steam at very high temperatures. This activation process creates an extremely high surface area material. Reagglomeration is the process that converts a raw coal material to a virgin coal GAC. Domestic coal carbons are reagglomerated because the coal raw material is soft and would lose about 50% of its mass to attrition if it were to be direct activated. To prevent this attrition, the carbon is first pulverized to a powder and a binder is added to create coal briquets. The briquets are then activated to produce GAC. Reagglomeration is not a performance enhancing process but necessary to efficiently use the softer domestic coal products with minimal attrition. Both direct activated and reagglomerated carbon were included in the pilot test to assess their PFAS removal effectiveness and to provide additional GAC sourcing opportunities to owners of groundwater treatment systems, assuming the pilot test does not demonstrate a significant performance difference between direct activated and reagglomerated GAC.

The types of GAC that were selected for this pilot test are described below. All four types are 12 x 40 mesh size, which means the majority of GAC media (approximately 90 to 91% by weight) passes through a United States standard size 12 mesh screen but is retained on a standard size 40 mesh screen.

- The AV1240CB is a direct activated 12 x 40 mesh bituminous coal carbon.
- The AV1240LDX is a low density, direct activated 12 x 40 mesh bituminous coal carbon. This low-density characteristic of this bituminous coal carbon is due to the geographical location from where the raw carbon is sourced (mined). The coal is sourced from a country which is not affected by tariffs, reducing purchase cost. Also, the weight of low-density carbon (carbon is sold by the pound) is less to fill the same bed volume. By including a low-density carbon product in this test, the efficiency and economics of this product can be evaluated and compared to the regular density GAC.
- The AV1240PFAS carbon is a new carbon to the market that has shown some promise for PFAS water treatment based on limited product performance data. At the time of selection, AqueoUS Vets® reported that AV1240PFAS carbon had only been tested in a few rapid small-scale column tests (RSSCTs) and few full-scale GAC water treatment sites.

- Calgon F400 is a reagglomerated bituminous coal carbon. F400 was selected for use in the WRD pilot tests due to its demonstrated good performance in previous studies by others (Liu et al., 2019).

The Calgon F400 and two of the AqueoUS Vets® AV carbon products represent commonly-available GAC water treatment products. There are multiple vendors that offer their own branded carbon that are similar to the AqueoUS Vets® AV products (based on our comparison of the product specifications). This provides multiple sourcing opportunities for the pumper that is planning or maintaining a water treatment system. This is also true for the Calgon F400 GAC - Cabot Norit offers a GAC 400 reagglomerated carbon which has similar specifications and may perform similarly. The exception to this comparison is the AV1240PFAS which is a proprietary carbon.

2.3 IX Selection Process

There are several PFAS-selective IX resins currently available. Each of these resin products is a "single-use resin" meaning the resin product is used once and then removed for disposal (i.e., not reactivated). Currently, most PFAS resins are disposed by landfilling or incineration. The paragraphs below list each resin and provide a brief description of the product and why it was selected for the pilot test.

- Purofine® PFA694E by Purolite is a polystyrenic gel PFAS-selective single-use ion exchange resin. Purolite is a leader in the current PFAS water treatment market.
- Dow Chemical Dowex PSR2 Plus is a strong base anion exchange resin that was initially developed for the removal of perchlorate from potable water. This resin has been shown to be effective for PFAS removal.
- ResinTech SIR-110-HP is a is a PFAS, nitrate, and perchlorate selective strong base anion resin that is less affected by sulfate ions. ResinTech's product testing has shown effective removal of PFOA, PFOS, as well as many other PFAS compounds.
- Resinex PFCR-2 is a strongly basic gel-type anion exchange resin, specifically developed for selective PFAS removal from potable water in the presence of high concentrations of sulfate.

Provider	Product Name	Description
Purolite	Purofine® PFA694E (PFA694E)	PFAS selective single-use IX resin
Dupont	PSR2 Plus	Perchlorate selective single-use IX resin
ResinTech	SIR-110-HP	PFAS selective single-use IX resin
Resinex	PFCR-2	PFAS selective single-use IX resin

The pilot test equipment was not NSF compliant – the NSF compliance was not necessary during pilot testing because the water was discharged under the facility National Pollution Discharge Elimination System permit and was not reintroduced into the water supply after treatment. The GAC and IX resins used are NSF 61 compliant.

2.4 System Design

The pilot test was designed to simulate full-scale operating conditions of the GAC columns with an empty bed contact time (EBCT) of approximately 10 minutes, consistent with manufacturer's recommendations. For the IX columns, a slightly accelerated flow rate was selected with the goal of limiting the total test duration. There was concern that the IX resin may have very long breakthrough times such that the test could not be concluded during the planned six-month duration. Therefore, a reduced resin bed volume and an increased flow rate were used to reduce the EBCT (by 50%) as well as the test duration. Furthermore, LHHCWD Well #10 was selected because it contained a higher sulfate concentration than other surrounding pilot test candidate wells. This higher sulfate concentration was expected to shorten the resin life and thus shorten the test duration. It was expected that the IX resin testing would last approximately five months in total duration. As previously mentioned, another objective of the IX testing was to compare the results to the vendors' predictive models and therefore, the selection of wells with higher concentrations of sulfate would not bias the results, performance evaluation, or life cycle costing. The GAC and IX pilot test scale and test conditions are summarized below.

Pilot System Conditions

Item	GAC	IX	Units
Flow Rate	0.25	0.72	gpm
Number of Trains	1	1	none
Vessel Diameter	0.33 (4)	0.25 (3)	Feet (inches)
Bed Volume	0.24	0.12	cubic feet (ft^3)
Vessel Area	0.09	0.05	square feet (ft^2)
Bed Depth	4.0	2.4	feet
Depth to Mid-column Sample Port	2.06	0.73	feet
Surface Loading Rate	2.9	14.7	gpm/ft^2
Flow/Volume	0.7	6.0	gpm/ft^3
EBCT	10.2	1.2	minutes
Approximate Treated Volume per Day	360	1,037	gallons

3.0 FIELDWORK, SAMPLING, AND ANALYSIS

In this section, the details of the test skid installation and startup are presented, including details of various challenges that occurred at startup. Following this, details of the well water and treated water monitoring, sampling, and laboratory analyses are provided. The treatment system monitoring, tuning, adjustments, and other pilot test maintenance is reviewed. Finally, a discussion of the pilot test duration is presented.

3.1 Test Skid Installation and Startup

The pilot test skid was fabricated by AqueoUS Vets® in their Redding, California plant. **Figure 3** is a piping and instrumentation diagram for the test skid, showing the location of the sediment filter, water distribution and collection manifolds, flow control valves, sampling ports,

flowmeters, and flow totalizer. Prior to transport, AqueoUS Vets® sourced and filled three of the GAC columns and three of the IX columns to the specified design heights in their Redding facility. The skid was transported to the LHHCWD Well #10 site on April 17, 2020, where it was offloaded, set in its final location, leveled, and secured (refer to **Appendix B** Photolog, Photo 1).

Once the test skid was on site, the fourth GAC column was filled with Calgon F400 GAC and the fourth IX column was filled with SIR-110-HP resin to the specified column heights. Those two products were shipped directly to GSI for inclusion in the test.

GSI coordinated with LHHCWD staff to make minor modifications to the existing well water distribution piping to allow a small flow to be diverted from the well's main supply pipe to the water treatment pilot test skid. The LHHCWD staff also assisted with the required plumbing to direct the treated water (test skid discharge) to be conveyed to the water discharge location.

On April 21, 2020, GSI and AqueoUS Vets® filled the columns with well water to soak the GAC and IX beds and remove air. The media was left to soak overnight. The skid was covered with fabric and opaque polyethylene sheeting to reduce light exposure and protect the instruments.

On April 22, 2020, GSI and AqueoUS Vets® backflushed the GAC columns. This was accomplished by isolating the IX columns (closing the valves above the IX columns) and gently flowing well water up through the GAC columns, suspending the GAC beds and removing fines from the media. This flushing was conducted intermittently until no more fines were observed to be flowing out of the sample ports for the columns. Backflush of the F400 media was not attempted because any upflow caused the F400 media to rise to the top of the column. During this operation, some of the GAC particles floated within the columns and flowed out of the columns. After completing the flushing, the carbon bed height in the AV1240PFAS column AV1240PFAS appeared to have been reduced and was thought to have lost some carbon during the flushing. Additional AV1240PFAS GAC was added to AV1240PFAS column to meet the column height design criterion and equalize the GAC column heights. Ultimately, all the GAC columns were at uniform height at the completion of this startup effort.

On April 24, 2020, GSI returned to the site for system startup (refer to **Appendix B** Photolog, Photo 2). The flow rates were adjusted to the design flow rate and flow and pressure parameters were documented on a site visit checklist and log. This checklist/log was used by GSI and the LHHCWD staff to ensure consistent data collection. Initial baseline samples were collected on this date.

3.2 Test Skid Monitoring, Sampling, and Analysis

GSI visited the LHHCWD Well #10 site weekly for monitoring and water sample collection for approximately the first six months of operation. Due to the very slow PFAS breakthrough across the test columns, the monitoring/sampling interval was extended to once every two weeks starting October 22, 2020. Similarly, the monitoring/sampling interval was switched to once every three weeks starting December 17, 2020, and ultimately monthly starting January 27, 2021. Throughout the pilot test, the monitoring/sampling schedule was also adjusted slightly depending on well shutdown periods. **Table 1** includes a summary of sample collection dates and sample analyses. LHHCWD staff visited the pilot test sites daily to verify operation and briefly document the system parameters.

During each of the weekly facility visits from system startup through September 17, 2020, GSI collected one influent sample of the untreated water and either an effluent or "midpoint" sample from each of the eight treatment columns. Water samples within the columns were collected at

approximately half of the bed volume for GAC columns and one third of the bed volume for IX columns and are referred to as “midpoint” samples throughout the remainder of this report. Samples were collected at each sampling port using the following sampling procedure:

- Nitrile gloves were donned. No waterproof clothing or boots were worn during sampling.
- Sample ports were purged for several seconds to remove stagnant water.
- Laboratory-provided sample bottles with Trizma preservative were slowly filled.
- Sample bottles were placed in laboratory-provided zip-loc bags and then into an iced cooler. The wet ice was also placed in zip-loc bags prior to placement into the coolers to prevent liquid contact with the sample bags.
- Samples were transported to a California Environmental Laboratory Accreditation Program certified laboratory, Eurofins Eaton Analytical in Monrovia, California under chain-of-custody procedures.

At the start of the test, an initial influent sample was analyzed for the parameters listed below, providing initial baseline water quality. To detect changes to the LHHCWD Well #10 water quality over the entire test duration, influent samples were also collected monthly and analyzed for this same full analyte list (see table below). The list of analytes for the more frequent influent, effluent, and QC sampling is also provided below. At the request of DDW (DDW/WRD meeting on July 8, 2020), additional sampling and analysis was conducted for bacteria during the pilot study. The laboratory reports are provided in **Appendix C**.

Baseline Water Quality Parameters (collected monthly)

Analyte	Analytical Method
PFAS	United States Environmental Protection Agency (EPA) 537.1
Sulfate	EPA 300.0
Nitrate	EPA 300.0
Alkalinity	SM 2320B
Chloride	EPA 300.0
Uranium	EPA 200.8
Perchlorate	EPA 314.0
Total Arsenic	EPA 200.8
Hexavalent Chromium	EPA 218.6
Total Iron	EPA 200.7
Total Manganese	EPA 200.8
Total Sodium	EPA 200.7
Total Potassium	EPA 200.7
Total Calcium	EPA 200.7
Total Magnesium	EPA 200.7

Analyte	Analytical Method
pH	Field Meter
Oxidation-Reduction Potential	Field Meter
Total Dissolved Solids	E160.1 / SM 2540C
Total Suspended Solids	SM 2540D
Oil & Grease	EPA 1664
Total Organic Carbon	SM 5310C
Volatile Organic Compounds (VOCs)	EPA 524.2

Influent, Effluent, and Quality Control Analytical Parameters (collected on specified intervals)

Analyte	Analytical Method
PFAS	EPA 537.1
Sulfate	EPA 300.0
Nitrate	EPA 300.0
Alkalinity	SM 2320B
Chloride	EPA 300.0
pH	Field Meter
Dissolved Organic Carbon	SM 5310C
Total Organic Carbon	SM 5310C

3.2.1 Field Quality Control

Water sample duplicates for PFAS influent samples were collected periodically for field quality control purposes. As a cost saving measure, the collection and analysis of these field duplicates was discontinued approximately three months after test startup because the first three months' results met the quality objectives. The field duplicates had demonstrated consistently acceptable relative percent differences between the primary and duplicate samples.

Field blanks for PFAS were also collected using laboratory-supplied water to confirm that field sampling procedures and laboratory analysis procedures did not introduce sources of contamination. After collection of twelve field blanks over approximately three months, collection and analysis of field blanks was discontinued due to no detections observed in any field blank samples.

3.3 Inspections, Tuning, Maintenance and Troubleshooting

During implementation of the pilot test, frequent inspections, tuning, maintenance, and troubleshooting were conducted to ensure effective operation of the test skid. These items included routine flowrate adjustments, filter changes, cleaning and prevention measures for algae growth, and pilot system maintenance during prolonged shutdowns.

3.3.1 Routine Flowrate Adjustments

During each facility visit, flowrates through each column were recorded. Direct read flowmeters (rotameters) were installed on each column so that the flowrate could be adjusted and tuned. If flowrates were not within 0.05 gpm of the design rate through GAC columns or 0.1 gpm of the design rate through IX columns, then flows were adjusted using the flow control valves underneath each column.

The total flow volume was initially calculated using two different readings: one using an electronic totalizer/flowmeter installed on one of four columns (one on the GAC side and one on the IX side) and the other using a mechanical flowmeter (rotameter) installed on each column and multiplying the observed flow rate by the incremental run time between readings. Following the first month of operation, it was determined that using the readings from a flowmeter installed on each individual column was a more dependable method for total flow volume calculation. The electronic totalizer/flowmeters were observed to report a lower totalized flow than the computed total flow using the mechanical flowmeters. The electronic totalizer/flowmeters were disassembled and cleaned but the flow volume disparity was not mitigated. Later, it was determined that resetting the totalizer/flowmeters every week would improve the discrepancy between two different total flow measurement methods.

3.3.2 Filter Replacement

The 10-inch x 4.5-inch, 5-micron sediment cartridge filter on the inlet side of the pilot skid was first replaced on June 23, 2020, approximately two months after system start-up. During this first replacement, a heavy sediment build-up was observed on the cartridge filter. Cartridge filter replacement was subsequently placed on a monthly schedule for the duration of pilot test to prevent heavy buildup of sediment and subsequent delivery pressure degradation.

3.3.3 Algae Growth

On June 9, 2020, possible algae growth (spotty discoloration) was observed on a small, localized portion of the PFA694E ion exchange resin column even though the pilot test skid was covered with the plastic and fabric sheets (refer to **Appendix B** Photolog, Photo 3). To address this, an additional sunlight protection measure was implemented: the GAC and IX media columns were covered with aluminum foil to block the light and prevent algae growth. Approximately once per month, the aluminum foil was removed to check for the presence of algae in GAC or IX columns and to document the color of IX resin. Following these inspections, the aluminum foil was reapplied to each column (refer to **Appendix B** Photolog, Photo 4). No additional growth of the suspected algae was observed in the PFA694E column throughout the remainder of the pilot test.

On June 16, 2020, algae growth was first observed in the AV1240PFAS GAC mechanical flowmeter (refer to **Appendix B** Photolog, Photo 5). For the pilot test duration, whenever additional algae growth was observed, each of the flowmeters was disassembled and cleaned using a soft brush. The flow meters were also covered with aluminum foil to prevent light penetration. On June 23, 2020, the algae spot previously observed on the PFA694E column was observed to have decreased in size and turned black. The aluminum foil wrap likely caused this algae spot to die. On August 6, 2020, the flowmeters were covered with blackout fabric for greater protection from light. The fabric was successful in preventing additional algae growth in the flowmeters for the duration of the pilot test. On September 3, 2020, some suspected algae growth was observed on the wall of the AV1240 column, but growth was not observed on or in the media. Two small algae spots were observed on October 15, 2020 in the SIR-110-HP column; one spot was above the media and the other was between the media and column wall.

Although small growths of algae were observed during pilot test, it was not considered to have an impact on the pilot test results. The observed algae occurred in small, localized films and was not observed to be growing within the media, but solely at the interface between the media the plastic column walls.

3.4 Well Shutdowns and Variable Pressures

The inlet pressure to the pilot skid was observed to increase by approximately 10 psi when both LHHCWD Well #10 and neighboring LHHCWD Well #11 were pumped simultaneously due to the increased head pressure in the water well conveyance piping. Although the pilot skid contained a pressure regulator, the flow rates still varied depending on whether LHHCWD Well #11 was operating. As a result, LHHCWD provided GSI the operating schedules for LHHCWD Wells #10 and #11 for the duration of the pilot. The operating schedules were used to help calculate the volumes of water treated by the pilot test columns by using the recorded flowrates for each pumping scenario between flowrate adjustment periods.

Frequent shutdowns of LHHCWD Well #10 presented difficulties in providing consistent flow to the pilot skid. Because of the presence of a check valve in the LHHCWD Well #10 conveyance piping, other wells were prevented from supplying water to the pilot skid. Therefore, when LHHCWD Well #10 stopped pumping, flow and pressure in the pilot skid dropped to zero. A vacuum break and check valve on the pilot skid prevented drainage of the columns. For the duration of the pilot test, LHHCWD Well #10 was pumped for about 86% of the time, not including a planned one-week shutdown for routine maintenance in late June 2020.

3.4.1 Auxiliary Pumping

On May 5, 2020, it was determined that the design flowrates could not be reliably achieved when LHHCWD Wells #10 and #11 were not simultaneously operating due to insufficient water pressure from LHHCWD Well #10. To increase the feed pressure while not relying on LHHCWD Well #11, a booster pump was installed on the inlet line on June 9, 2020. In addition, a low-pressure, suction-side pressure regulator was installed on the booster pump inlet to regulate the variable inlet pressure. The booster pump accepted the low-pressure water stream and provided an additional 40 psi of pressure to the test skid. This setup succeeded in providing the needed pressure to maintain consistent flowrates to the test skid.

The booster pump was shut down on October 1, 2020 after exhibiting signs of pump stress (overheating, loud noise). Inspection of the pump suggested that sand may have caused the failure due to impeller wear. A new booster pump was installed on October 8, 2020. The new booster pump was outfitted with a suction-side, 50-micron sediment filter to remove sand at the booster pump inlet. The sediment filter was purged daily and cleaned weekly. On October 29, 2020, a coarser 200-micron sediment filter replaced the 50-micron filter to increase the pressure on the booster pump inlet. On December 13, 2020, the booster pump was again shut down due to irregular pump noise and vibration. It was thought that a combination of frequent well stops and starts, reduced inlet pressure due to the suction side filter and small diameter feed hose, and the presence of the suction-side pressure regulator contributed to an unacceptable feed pressure that lead to pump failure. A new booster pump was installed on December 31, 2020 that eliminated the use of a sediment filter and pressure regulator. A hose timer was also added to the discharge side of the pump to periodically purge water to remove sand and air accumulation and reduce cavitation. This pump continued to run until the completion of the pilot study. Refer to **Figure 3** (piping and instrumentation diagram) for details on the plumbing layout.

3.5 Pilot Test Duration

Key performance measurements for the pilot test were influent and effluent PFAS concentrations (with a primary focus on PFOA and PFOS) and time to breakthrough (on a bed volume basis) for each PFAS analyte. The initial planned duration of the pilot test was 26 weeks. The objective was to run the test until the PFOA or PFOS concentration achieved 50% breakthrough (treated concentration divided by initial concentration or C/C_0) or until the PFOA or PFOS concentration reached their respective RLs.

However, after approximately six months of operation, the GAC and IX media performed very well and the PFOA and PFOS breakthrough was insufficient to meet these objectives. Due to the extended time for PFAS breakthrough for several of the media and to obtain some early insight as to how the media was performing, it was decided that midpoint (mid-column) samples would be collected on a monthly basis beginning June 30, 2020. Note that for the GAC, this sample port was located approximately in the middle of the column while on the IX columns, this sample port was located approximately one-third down the column length, representing approximately 33% of the column length. The results from the midpoint samples provided information on the rate of PFAS breakthrough within each column so that the overall duration of the pilot test could be better estimated, and the water sampling schedule could be appropriately modified for increased cost efficiency.

In coordination with WRD, the pilot test was ultimately extended to April 22, 2021, a total of approximately 12 months. During this time, approximately 48,000 bed volumes were treated through each of the GAC columns and approximately 450,000 bed volumes were treated through each of the IX columns.

4.0 PILOT TEST RESULTS

In this section, the pilot test field observations, the influent chemistry, the GAC and IX removal performance for PFOA and PFOS, the removal performance for other PFAS, and finally, data validation and usability are addressed.

4.1 Pilot Test Field Observations

The well delivery pressures for LHHCWD Well #10 were variable throughout the pilot test, mostly dependent on whether LHHCWD Well #11 was running simultaneously with LHHCWD Well #10. Well delivery pressures generally varied from about 12 to 30 psi. The operating schedule for LHHCWD Well #10 was also variable. This is important because the test skid flow to each test column was adjusted by control valves that restrict flow. On average, the well ran for about 86% of the time throughout the pilot test, but there were periods of extended consistent operation (99.3% runtime during the first two weeks of April, for example) and intermittent operation. The variable skid inlet pressures and well operation schedule led to difficulties in setting and maintaining a consistent delivery flowrate to each column. The low pressures also did not allow for the design flowrates to be achieved without the use of auxiliary pumping. The addition of a booster pump improved the ability to maintain consistent flowrates through the test skid.

LHHCWD Well #10 water contained some fine sand that necessitated monthly cartridge filter replacement on the pilot skid inlet. In addition, algae growth was observed in the media intermittently throughout the pilot test. The presence of algae was likely exacerbated by intermittent flow and resulting occasional stagnant water in the test columns.

The GAC and IX resin bed heights did not change throughout the pilot test, indicating that little settling of the media occurred after the system startup and a consistent bed volume was maintained.

4.2 Influent PFAS and Background Chemistry

Influent PFAS and background chemistry constituents were measured on a weekly and/or monthly basis during the pilot study. The following table summarizes the concentration ranges of PFAS in LHHCWD Well #10 untreated water.

LHHCWD Well #10 Untreated Water PFAS Concentration Summary

Compound		Untreated Water Concentration (ng/L)		
Full name	**Abbreviation**	**Min.**	**Max.**	**Avg.**
Perfluorooctanoic acid	PFOA	11	17	12.33
Perfluorooctanesulfonic acid	PFOS	29	37	31.44
Perfluorohexanesulfonic acid	PFHxS	5.88	7.33	6.33
Perfluorobutanesulfonic acid	PFBS	5.33	7.22	6.22
Perfluorohexanoic acid	PFHxA	2.5	7.88	3.44
Perfluoroheptanoic acid	PFHpA	<2.0	2.9	0.33
Perfluorononanoic acid	PFNA	2.7	3.4	3.00

Notes

For PFAS with non-detect results, 0 was substituted for the calculation of the average concentration.

The water background chemistry established with the baseline water quality sampling was stable throughout the pilot test duration. The key background chemistry parameters that were measured routinely included:

- Nitrate (as nitrate), which varied between 12 and 13 mg/L;
- Sulfate, which varied between 160 to 180 mg/L; and
- TOC, which varied between 0.6 to 1.6 mg/L.

Dissolved organic carbon (DOC) measurement began in 2021 with influent DOC concentrations varying between 0.6 and 1.2 mg/L. The full set of these data are presented in **Table 2**.

Additional background chemistry parameters were monitored on a monthly basis during the pilot study. Out of these parameters that were monitored monthly, some influent characteristics are listed below:

- The water had elevated total hardness that was consistently above 300 mg/L as $CaCO_3$;
- Iron concentrations were below detection (<0.020 mg/L) except for the first pilot test sampling event;
- VOCs as measured by EPA Method 524.2 were detected at very low concentrations during the pilot test (maximum detections of 2-butanone, chloroform, and total trihalomethanes were 5.8, 0.81, and 0.81 µg/L, respectively); and
- Concentrations of oil & grease (hexane extractable material) were measured during the pilot test ranging from non-detect (<0.95 mg/L) to 3.52 mg/L.

The full set of these data are presented in **Table 3**.

4.3 PFOA and PFOS Removal Performance

GAC and IX resin breakthrough curves for PFOA and PFOS are presented in **Figures 4 and 5** and **Figures 6 and 7**, respectively. The breakthrough curve plots show the effluent concentration

of either PFOA or PFOS in ng/L on the primary y-axis as a function of the bed volumes treated on the primary x-axis. A blue line represents the volume of water treated, which is shown on the secondary y-axis. A secondary x-axis shows the operational time equivalent to bed volumes treated in months.

A recent report by Jacobs Engineering Group, Inc. (Jacobs), in partnership with Orange County Water District (OCWD), suggests that selecting 60% of the influent concentration (or the analyte RL, whichever is lower) as the lead vessel changeout criterion is more optimal and economical than the more typically used 50% (Jacobs, 2021). To allow for comparison with that study, in addition to the RL, the data from the current pilot study are also discussed using the additional breakthrough criterion of 60% of the influent concentration (7.4 ng/L for PFOA and 18.8 ng/L for PFOS).

Over the course of the pilot study, PFOS concentrations did not exceed the RL of 40 ng/L or 60% of the influent concentration in the effluent or midpoint samples for any of the GAC or IX columns (**Figures 5 and 7**). Therefore, in all cases, the effluent PFOA concentration controls the timing of GAC or IX media changeout.

Due to better than anticipated performance, PFAS had not broken through many of the GAC media by the completion of the pilot test and many of IX media broke through but did not reach the RL. To address this and assist WRD and the pumpers at LHHCWD with decisions regarding choice of adsorbent media for PFAS removal, breakthrough curves for PFOA were linearly extrapolated to the RL when necessary (**Figures 8 and 9**). This method of bed life estimation provides an additional level of conservatism because the breakthrough curve slope should become shallower as it approaches the influent concentration. This means that a linear extrapolation of the breakthrough curve would intercept the RL in fewer bed volumes than the actual curve, if the pilot were allowed to operate to complete breakthrough.

Because none of the GAC columns were operated long enough to observe appreciable PFOA in effluent samples, midpoint samples were used to help estimate GAC bed life (**Figure 8**). These bed lives were multiplied by a factor of 1.5 to approximate what the bed life of the full bed would be. This approach is in part based on the empirical relationship between the midpoint and the full bed volume bed lives for the GACs that were observed at the Montebello Land and Water Company Water Supply Well #7 pilot test (GSI, 2021). The full bed lives for the GACs at the MTBLW were approximately 1.5 to 2 times larger than those determined for the column midpoints, which suggests that using a scale-up factor of 1.5 is both reasonable and somewhat conservative. Because there is no reliable way to scale up observed bed life when the bed volume is doubled, the GAC bed life estimates presented in this report should not be considered perfect representations of the GAC PFAS removal performance at LHHCWD Well #10.

Linear extrapolation was also used to estimate bed lives for three of the IX resins using incomplete breakthrough curves.

A summary of the time for PFOA to breakthrough GAC and IX is presented in the below table in bed volumes.

LHHCWD Well #10 Breakthrough Summary

Media	Estimated Breakthrough Time for PFOA in Bed Volumes	
	RL	60% of Influent Concentration
Granular Activated Carbon		
F400	94,500*	84,000*
AV1240LDX	72,00072**	67,500**
AV1240CB	67,500**	54,000**
AV1240PFAS	67,500**	51,000**
Ion Exchange Resin		
PSR2 Plus	670,000***	540,000***
SIR-110-HP	510,000***	450,000***
PFCR-2	490,000***	440,000***
PFA694E	400,000	360,000

Notes
All breakthrough times were determined by linear interpolation of effluent concentrations unless otherwise noted.
* Breakthrough time was estimated by linearly extrapolation of incomplete midpoint "breakthrough" curve. This value was then increased by a factor of 1.5 to approximate the breakthrough time for the full bed volume.
** Breakthrough times were estimated by increasing the midpoint "breakthrough" time by a factor of 1.5 to approximate the breakthrough time for the full bed volume.
*** Breakthrough time was linearly extrapolated from incomplete full bed volume breakthrough curves out to the RL or 60% criteria.

Overall, the F400 and PSR2 Plus appear to have the longest bed lives of all GACs and IX resins tested, respectively.

4.4 Removal of Other PFAS

The order of 100% breakthrough for PFAS generally followed chain length within the perfluorocarboxylic acid and perfluorosulfonic acid groups for both GAC and IX, with shorter chain PFAS breaking through first. Breakthrough order was determined based on a number of factors including midpoint sampling, effluent sampling, and observations from the MTBLW pilot study that were used to estimate time to breakthrough for PFOA.

For GAC columns, PFAS breakthrough (100%) order generally followed the order for most media:

$$PFBS < PFHxA < PFOA < PFOS$$

The placement of PFHxS in the ordering could not be confirmed because elevated concentrations were only detected in midpoint columns. PFHpA and PFNA were also not included in the breakthrough time ordering due to the fact that for the duration of the pilot study, most almost all influent samples were below detection for PFHpA and all effluent samples were non-detect for PFNA. The F400 GAC tended to retain PFBS, PFHxA, and PFOA better than the other three activated carbons. Perfluorosulfonic acids typically broke through the activated carbon columns later than the perfluorocarboxylic acids with the exception of PFBS.

For IX columns, PFAS breakthrough (100%) order was less clear. PFHxA generally reached 100% breakthrough early than anticipated for PFOA. With respect to the perfluorosulfonic acids, they were better retained than PFHxA and PFOA, however their exact breakthrough order could not be confirmed by the pilot test data. PFHpA and PFNA were again not included in breakthrough

order consideration for the same reasons previously presented for the GAC columns. The IX columns retained perfluorosulfonic acids, including the short-chain PFBS, considerably better than GAC relative to perfluorocarboxylic acids.

Breakthrough curves for other PFAS are presented in **Appendix D**. Midpoint and effluent concentrations are presented in **Table 4** for GAC columns and **Table 5** for IX columns.

4.5 Bacterial Testing

Influent and effluent water from the pilot test skid was analyzed for fecal indicator bacteria including *E. coli* and total coliforms to ensure bacteria were not colonizing on the media columns. Neither *E. coli* nor total coliforms were present in influent or effluent samples measured four months after the start of the test (August 30, 2020). The results of this sampling are presented in **Table 6**.

4.6 Data Validation

All PFAS analytical results were evaluated and validated using the *Data Review and Validation Guidelines for Perfluoroalkyl Substances (PFASs) Analyzed Using EPA Method 537* published by the United States EPA in November 2018. Nearly all samples met the criteria for PFAS analyses contained within this document and no results were qualified except for several results for the influent sample from May 19, 2020. Due to the anomalously low values within this set of data compared with the larger data set, these data were excluded from plots and calculations.

The results of all other inorganic and organic analyses conducted during this study were evaluated and validated using the *National Functional Guidelines for Inorganic Superfund Method Data Review* and the *National Functional Guidelines for Organic Superfund Methods Data Review*. During this process, several influent sample results were qualified. Results for alkalinity and total suspended solids samples collected on March 21, 2021 were qualified for being analyzed outside of holding times. The result for a total arsenic sample collected on March 21, 2021 was qualified due to detection of the analyte in the method blank. Neither of these data qualifications affected the usability of the data. A complete description of the data validation and usability assessment is presented in **Appendix E**.

5.0 DATA EVALUATION AND DISCUSSION

In this section, the data generated during the pilot testing is discussed in the context of similar pilot tests and studies that have also examined PFAS removal from by GAC and IX with the primary discussion topics including overall pilot system PFAS removal performance, how contact time may affect bed life estimates, GAC and IX removal performance, and competing ions.

5.1 Pilot System Operation

There were no significant operational differences between the GAC and IX pilot system column operations. No media type appeared distinctly susceptible to significant algae growth or other biofouling.

5.2 PFAS Pilot System Removal Performance

Due to better than anticipated PFAS removal performance by the tested media, an optimal performing media, with respect to PFOA adsorption capacity, could not be confirmed for LHHCWD Well #10. However, using midpoint sample results, overall PFAS removal behavior, and breakthrough curve behavior, better performing media were identified.

Because of the differences in the RLs between PFOA and PFOS, and their relative concentrations in the LHHCWD Well #10 water, PFOA is the primary driver for media changeout. Typical influent concentrations for PFOA ranged between 11 and 17 ng/L at this site, which puts the water above the 10 ng/L RL. PFOS concentrations in the influent were below its RL of 40 ng/L for the duration of the test. The choice of using the RL as the media changeout trigger as opposed to a different threshold (e.g., NL or 60% of influent concentration) was made based on discussions with treatment system vendors and the results of the lead-lag performance modeling conducted by Jacobs as part of the OCWD PFAS Treatment Testing Study. Using the performance modeling results presented in the Jacobs' report, the concentration in the lag vessel effluent was predicted to be non-detect (<2 ng/L) when using a changeout target of 60% of the influent concentration, which was higher than the PFOA RL (11.1 ng/L) (Jacobs, 2021). Their model results show that the effluent concentration of PFOA in the lag vessel was non-detect through the point at which the lead vessel effluent reached the PFOA RL. Because LHHCWD Well #10 had lower PFOA concentrations than those in the OCWD pilot test in addition to the results of the Jacobs lead-lag model, using the RL as a changeout trigger for LHHCWD Well #10 is anticipated to be sufficiently protective to prevent lag vessel breakthrough above the current PFOA detection limit of 2 ng/L.

As previously mentioned, one of the limitations of this study was the inability to observe PFOA and PFOS at the respective RL in the column effluents for many of the tested media. To overcome this, linear extrapolation of the breakthrough curves was used to predict bed life using the PFOA RL criterion. This is a conservative approach because breakthrough curves typically will asymptotically approach the influent concentration. By using straight line extrapolation, the bed life that is estimated is most likely lower than what would have been observed.

5.3 Contact Time

Because of the need to limit the duration of the test for budgetary reasons, the EBCT of the IX columns was reduced from the manufacturer recommended 2.5 minutes down to 1.2 minutes. Additionally, the breakthrough curve information for the GAC columns is effectively for a halved EBCT because elevated PFOA concentrations were only detected in midpoint samples. The GAC midpoint sample results were used to estimate bed lives for the full bed volume by multiplying the bed lives for midpoint samples at the PFOA RL by a factor of 1.5. It is expected that generally increasing EBCT causes improved removal performance due to longer contact time between the

media and the contaminated water. Results from a companion pilot study conducted at MTBLW Well #7 that used the same GAC products show that generally the full bed volume bed lives were about 1.5 to 2 times greater than determined using midpoint samples (GSI, 2021). This supports using a factor of 1.5 to reasonably estimate full bed volume bed lives for the GACs while retaining a level of conservatism.

While reasonable, this method does have some limitations, notably the potential for short circuiting and competition effects with other source water constituents. Because these columns are relatively small in scale, there is the potential that water would find preferential flow paths and therefore the observed bed volumes for midpoint sample breakthrough may not accurately represent a larger system. Based on our experience with smaller-scale pilot and laboratory columns, these preferential flow paths that would cause short circuiting are more likely to develop between the media and the column wall. While no such flow paths were observed along the column walls, it is possible that they could have developed inside the column beds. With respect to competition effects, longer EBCTs can potentially reduce removal performance for target contaminants via preloading with other constituents, such as natural organic matter (NOM), that travel through the bed faster. Park et al. (2020) noted that while previous studies have found NOM to interfere with PFAS adsorption in this manner, they did not observe the phenomenon in their column studies. They hypothesize that the DOC in their experiments did not cause increasing PFAS adsorption interference at longer EBCTs due to the DOC being overall more hydrophobic. Without a more detailed analysis of the TOC composition, it is difficult to determine if longer EBCTs would have this effect on GAC adsorption of PFAS at LHHCWD Well #10.

The pilot results showed improved PFOA bed capacity for all media tested compared with those reported by OCWD; however, it is unclear how much of that is attributable to influent water chemistry or contact time. To truly optimize a GAC treatment system using one of the media tested in this study, additional pilot testing for a longer duration would be required. In terms of the life cycle costs developed in Section 6, sensitivity analysis was used to determine how sensitive life cycle costs would be to perturbations in the estimated bed lives.

5.4 Granular Activated Carbon Performance

Of the four tested activated carbons, the Calgon F400 lasted the longest in terms of time to breakthrough at the RL of 10 ng/L.

PFOA was detected in GAC column midpoint samples earlier than PFOS, despite having a lower loading concentration in the influent water. This indicates that PFOS has a higher affinity for the GAC adsorption than PFOA.

While the effects of TOC and DOC in source water were not quantified during this study, it is anticipated that the presence of approximately 1 mg/L of TOC/DOC in the source water likely impacted removal of PFAS by GAC. GAC has been used for decades as a unit process to remove total and dissolved organic carbon from drinking water to improve characteristics such as odor and taste. Because the concentrations of TOC/DOC and PFAS in the source water differ considerably (approximately 100,000 times more TOC/DOC than PFAS), it is to be expected that some of GAC adsorption capacity would be taken up by organic carbon which would reduce the total mass of PFAS that could be removed. Higher TOC/DOC concentrations would likely reduce the bed lives of the GACs that were observed during the pilot test while lower concentrations would likely have the opposite effect. As previously mentioned, it is not simply the presence of TOC/DOC that impacts PFAS removal by GAC, but characteristics of the organic carbon, especially hydrophobicity. The pilot test conducted by GSI at MTBLW Well #7 had similar concentrations of TOC and DOC, however there was measurable PFOA in effluent samples collected during the testing, whereas there was only measurable PFOA in the effluent of one of

the GAC columns at LHHCWD Well #10 at month 12 of the test (GSI, 2021). This suggests the possibility that the TOC measured at MTBLW Well #7 had characteristics causing reduced PFOA removal capacity that the water from LHHCWD Well #10 lacked.

When considering the suite of PFAS that were measured using EPA Method 537.1, removal capacity of PFAS by the GAC products tended to follow the same observed patterns that have been observed in other studies (Liu et al., 2019):

- The perfluorocarboxylic acids typically broke through before the perfluorosulfonic acids; and
- Within each type, GAC tended to retain longer-chain PFAS better than shorter-chain PFAS.

Chromatographic peaking, a phenomenon where effluent concentrations from a fixed-bed adsorption reactor exceed the influent concentrations, was only observed for PFBS in effluent samples from the GAC columns. This suggests that PFBS is desorbing from the GACs and being replaced with other compounds that have higher affinities for adsorption than PFBS, such as longer chain PFAS or other water constituents (e.g., DOC). Because of the limited duration of the pilot study, it is unclear whether other PFAS compounds, such as PFOA, would also exhibit this type of behavior with the GAC products.

5.5 Ion Exchange Resin Performance

Test skid effluent PFOA concentrations exceeded the RL for only one of the tested IX resins, PSA694E. While not confirmed by this pilot study, based on early breakthrough curve behavior, the PSR2 Plus IX resin appears to have the largest PFOA removal capacity of the four IX resins. PSR2 Plus was also found to have the largest PFOA removal capacity based on the results of pilot test conducted at MTBLW Well #7 (GSI, 2021). A longer duration would be needed to confirm which IX resin ultimately has the best PFOA removal performance for LHHCWD Well #10.

5.5.1 Competing Ions

Elevated sulfate concentrations had a lesser impact on PFAS removal by the IX resins than anticipated. LHHCWD Well #10 was chosen in part due to relatively high sulfate loadings of 160 to 180 mg/L, which were anticipated to shorten the pilot duration and provide data to reflect a “worst case scenario” in terms of competing ions. While effluent samples from this study were not analyzed for general water quality constituents, other studies have considered the potential for competition between PFAS and inorganic ions for adsorption on IX resin. During the OCWD pilot, PSR2 Plus did not significantly remove sulfate at similar influent concentrations to those found in the current study (about 2% of influent sulfate mass) (Jacobs, 2021). However, not all IX resins behaved this way. The investigators also observed that ECT2 SORBIX IC4 and Purolite PFA694E (also used in the current study) significantly removed sulfate initially during the pilot test (approximately 27% and 17% of influent sulfate mass, respectively) (Jacobs, 2021). Based on these observations, it is unlikely that sulfate impacted PFAS removal performance by PSR2 Plus but suggests that it likely affected PFA694E performance, which had the most rapid PFOA breakthrough.

The source water for this pilot test also contained nitrate in the range of 12 to 13 mg/L as nitrate. The OCWD pilot study source water contained lower levels of nitrate (2.21 mg/L), and found that all tested IX resins, including PSR2 Plus, removed nitrate to treated water concentrations of approximately 0.05 mg/L at the start of the study (Jacobs, 2021). The presence of nitrate in the source water for the current study may have reduced IX resin capacity for PFAS and consequently reduced the time to breakthrough, however nitrate impacts on IX performance were not confirmed.

The observations from the OCWD pilot study coupled with the results of this study and suggest that PSR2 Plus can remove PFAS even in the presence of elevated sulfate concentrations and confirms the importance of considering the potential effects of competing anions on the performance of IX resins when evaluating treatment alternatives as some resins may have been impacted by competing ions.

5.5.2 Comparison of Pilot Results with Vendor Models

The results generated by this study were deemed too incomplete due to insufficient test time for meaningful comparison with vendor IX breakthrough models.

6.0 LIFE CYCLE COST ANALYSIS

Life cycle cost analysis (LCCA) for the GAC and IX alternatives was conducted to provide information on the cost-effectiveness of the tested GAC and IX media. Life cycle costs include both annual O&M costs and initial capital costs to purchase and construct the treatment systems. Capital costs include the treatment trains, initial media fill, and installation fees (Equipment and Installation Capital Costs) but does not include site-specific work such as site work, yard piping, foundations, additional process equipment (prefiltration, backwash tank, etc.), total installation costs for site, electrical, instrumentation & control, general conditions, overhead, contractor profit, bonds and insurance, engineering and permitting, and contingency. Capital costs are presented as 2021 costs and are not escalated. O&M costs consist of media changeouts, including both the cost of new media and disposal of spent media, and annual pumping costs (increase in electricity cost) in excess of baseline that are associated with differential head loss between GAC and IX systems. Cash flows were developed that included O&M costs at the end of the year in which they were incurred. We applied a 5% discount rate and a 3% inflation rate and assumed a 20-year operational period. For comparison, the cash flows for each treatment approach are shown as net present value (NPV) costs. Using this approach, we can compare all tested media. Detailed discussion was only provided for the two most cost-effective GACs (F400 and AV1240LDX) and the two most cost-effective IX resins (PSR2 Plus and PFCR-2). Additional assumptions used in the analysis are presented in the following section.

6.1 Assumptions

The following assumptions and included rationale were used to develop the cost estimates:

1. The alternatives were evaluated over a 20-year lifetime;
2. A 5% discount rate (and a 3% inflation rate was applied to the cash flow);
3. A 10% tax rate was applied to the cost of equipment and virgin media;
4. Each alternative was assumed to treat the same volume of water over the 20-year lifetime;
5. Costs were applied at the end of the year in which they were incurred with capital costs being incurred at end of year 0;
6. Treatment system vessels would be setup in a lead-lag configuration to allow for the maximum utilization of the lead vessel media prior to changeout;
7. GAC and IX media changeouts would occur at PFOA RL breakthrough in the lead vessel and not on a predetermined basis;
8. Full-scale systems would incorporate bag filter pretreatment for sediment removal, similar to that which was used during the pilot testing to remove sediment;
9. Flowrates and EBCT would conform with manufacturers' specifications in full-scale treatment systems;

10. Certain costs that were assumed to be equal between GAC and IX system alternatives were excluded from the LCCA and include site-specific work such as site work, yard piping, foundations, additional process equipment (prefiltration, etc.), total installation costs for site, electrical, instrumentation & control, general conditions, overhead, contractor profit, bonds and insurance, engineering and permitting, and contingency;
11. IX resin is assumed to require landfill disposal (incineration would increase disposal costs);
12. GAC is assumed to be reactivated by the manufacturer and returned to site for reuse;
13. Backwashing during bed operation is not vendor recommended and was not included in the analysis;
14. Freight costs for new media were included in the media unit price for the LCCA;
15. The cost of filling and emptying the media vessels was excluded due to being small in comparison with media costs; and
16. To account for differences in head loss through the pressure vessels for the GAC and IX systems, estimates of differential pumping costs (provided by AqueoUS Vets) are included in the LCCA.

6.1.1 Effect of Influent Water Quality on Cost Estimation

Adsorbent media bed life will vary between different water sources depending on contaminant loading and background water chemistry. The influent source water used in the pilot testing was simultaneously distributed to each media type such that influent concentrations of all constituents were the same for all media types and are not expected to have disproportionately impacted the relative efficiencies between the different media types. General best operational practices would be to pretreat the water for total suspended solids and other interfering compounds (e.g., oil and grease) to the extent feasible prior to passing water through the GAC or IX vessels; however, this pretreatment was not included in the life cycle cost estimates. GAC is capable of treating most organic co-contaminants that may be present, with the primary impact being increased GAC consumption, which may require more frequent changeouts. Also, anions such as nitrate and sulfate can compete for ion exchange sites on the resins even though the resins are selective towards PFAS. Therefore, the influent concentrations of these will affect changeout frequency.

6.2 Full-Scale System Design

The below table summarizes design parameters for the full-scale GAC and IX treatment system alternatives:

Full-Scale Conditions

Items	GAC	IX	Units
Train Flow Rate	767	1,150	gpm
Number of Trains	3	2	none
Vessel Diameter	12	12	feet
Bed Volume	1,025	384	ft^3
Vessel Cross-Sectional Area	113	113	ft^2
Treatment train Footprint	380	395	ft^2/train
Total Adsorption Treatment System Footprint	1,140	790	ft^2
Bed Depth	8.9	4.4	feet
Surface Loading Rate	6.8	10.2	gpm/ft^2
EBCT	10	2.5	minutes
Treated Volume per Day	2,160,000	2,160,000	gallons

Notes
Each train is comprised of two (2) 125 PSI ASME code adsorbers with interconnecting pipe and additional fittings and connectors including: two graphite rupture disks per system for pressure relief, 8-inch carbon steel ring header and 8-inch carbon steel manifold (GAC) or 10-inch carbon steel manifold (IX), nine wafer-style butterfly valves with cast iron body and nylon coated ductile iron disc, and a 316 stainless steel four-point upper distributor included in each adsorber (IX only).

6.3 Capital Costs

6.3.1 Spatial Requirements

GAC systems require lower surface loading rates and higher EBCT compared to IX systems (e.g., 10 vs 2.5 minutes). This means that in terms of treatment trains, for a given design flowrate, more GAC treatment trains are needed. Overall, this results in a treatment system footprint for GAC treatment that is typically larger than for IX treatment. For a full-scale design flowrate of 2,300 gpm the GAC and IX treatment alternatives have the following footprint requirements:

- The GAC treatment system has a footprint of 1,140 ft^2 (three trains are required, each with a footprint of 380 ft^2); and

- The IX treatment system has a footprint of 790 ft^2 (two trains are required, each with a footprint of 395 ft^2).

The above footprint estimates only account for the treatment train area and do not include additional space required for specific treatment system arrangements, vehicular access, and other required system components such as prefiltration or backwash facilities. GAC systems also have an overall height of approximately 19 feet compared to an approximately 16-foot IX system height, which could have implications for indoor or residential treatment areas. In crowded residential neighborhoods, space restrictions and aesthetic considerations may make a more compact, longer-running resin-based system more desirable.

6.3.2 Cost of Initial Media

The following media costs were considered during the life cycle cost evaluation. When evaluating carbon cost, it is important to assess the cost per ft^3 and not simply the price per pound (lb). Each carbon has a different apparent density. The EBCT is measured using carbon volume, not weight; however, GAC is purchased on a per pound basis. The budgetary cost per cubic foot is provided in the tables below. These unit costs include freight but do not include tax.

GAC Products

Media	Apparent Density (lbs/ ft^3)	Cost ($ per lb)	Cost ($ per ft^3)
AV1240	31.2	$1.65	$51.48
AV1240LDX	25.0	$1.55	$38.75
AV1240PFAS	28.7	$1.90	$52.82
F400	33.7	$1.75	$58.98

IX Products

Media	Apparent Density (lbs/ ft^3)	Cost ($ per lb)	Cost ($ per ft^3)
PSR2 Plus	43	$6.40	$275.00
SIR-110-HP	41	$7.56	$310.00
PFA694E	42	$6.55	$275.00
PFCR-2	42	$5.60	$235.00

6.3.3 Treatment System Components and Installation

Below is a summary of estimated capital costs for the two best performing GACs and IX resins that were used in this LCCA:

Item	F400 GAC	AV1240LDX GAC	PSR2 Plus IX Resin	PFCR-2 IX Resin
Train Cost (lead-lag)[1]	$1,470,356	$1,470,356	$914,760	$914,760
Total Initial Media Cost (unit cost)	$598,449[2] ($58.98/ft^3)	$393,216[2] ($38.75/ft^3)	$466,400[3] ($275.00/ft^3)	$396,000[3] ($235.00/ft^3)
Installation Cost	$12,000	$12,000	$12,000	$12,000
Total Equipment and Installation Capital Cost[4]	$2,081,000	$1,876,000	$1,393,000	$1,323,000

Notes

1. GAC alternatives require three trains ($490,000/train including tax) while IX alternatives require two trains ($457,500/train including tax).
2. Includes enough GAC to fill the two vessels on each train (6 loads) to the design bed height plus "swing" loads (3 loads) of GAC to be warehoused, used for changeouts, and reactivated. Includes freight costs.
3. Includes enough IX to fill the two vessels on each train to the design bed height. Includes freight costs. Costs include a 10% sales tax rate on equipment and initial media purchase.
4. Rounded to nearest $1,000.

The above does not include costs for drinking water distribution system tie-ins or other construction costs. The equipment and installation capital costs are simply costs to set the treatment equipment and make minor plumbing connections. Additionally, the above tables include three "swing" loads of GAC because the GAC is assumed to be reactivated by the manufacturer. This means the capital costs include enough GAC to initially fill all treatment vessels (six loads) to their design bed heights plus three loads of GAC that can be warehoused and used for the changeout of the lead vessels. This is further discussed in Section 6.4.3.

6.4 Operations and Maintenance Costs

LCCA was conducted for all tested media, but only the two best performing media of each type, which were the F400 and AV1240LDX GACs and the PSR2 Plus and PFCR-2 IX resins, are discussed in detail. The following sections describe the individual costs that make up the O&M costs included in this LCCA.

6.4.1 Media Bed Life and Changeout Frequency

The LCCA assumes that media changeouts would occur when the PFOA concentration in the lead vessel exceeded the RL of 10 ng/L. This would maximize the media efficiency - in this case, the IX resins all have bed lives greater than 12 months.

Because the PFOA RL is currently the most stringent PFAS guidance criteria for drinking water in California and the relative affinity of PFOA for removal by adsorption, PFOA breakthrough was determined to be the primary driver for media changeouts. Although PFOS was present in influent

water at higher concentrations than PFOA, PFOS did not reach effluent concentrations exceeding the current RL of 40 ng/L during the pilot test. The PFBS response level was recently established at 500 ng/L, which is significantly higher than the influent concentration of PFBS. Other PFAS, including PFHxS, PFHpA, and PFNA, which do not yet have regulatory concentration guidance, notification, or proposed MCL concentrations in California, had a variety of breakthrough times, some of which were earlier or later than that of PFOA. In general, shorter chain PFAS have lower GAC loading capacities and faster breakthrough times than the longer-chain PFAS such as PFOA and PFOS. GAC can also be used as pretreatment to remove non-PFAS organics and longer-chain PFAS, followed by IX to remove short-chain PFAS, should removal of short-chain PFAS become an important regulatory consideration in the future.

Because of better than anticipated performance and limitations on overall pilot test duration, media bed life estimates contain some assumptions that should be considered:

- For media that did not reach PFOA RL concentrations in the column effluent before the end of the pilot study, extrapolation of effluent concentration trends was used for bed life estimation;
- For all GAC columns, linear extrapolation was applied to midpoint breakthrough curves with the estimates being increased by a factor of 1.5 to approximate the bed life of the full column;
- EBCT differences between the IX pilot and the proposed full-scale system (1.2 vs. 2.5 minutes) are assumed to not affect overall breakthrough behavior and bed life; and
- The bed lives previously described in Section 5.2 were used to estimate full-scale performance for the purposes of this LCCA.

Costs for media changeout were applied at the end of the years in which they are anticipated to occur based on the estimated full-scale bed life.

6.4.2 Energy Costs

Estimates of the energy costs for pumping associated with the media vessels were provided by AqueoUS Vets. These costs were developed under the following assumptions:

- Flow rates of 767 and 1,150 gpm for the GAC and IX treatment trains, respectively;
- Pump motor efficiencies of 75%;
- Energy cost of $0.08 per kilowatt-hour (kWh);
- Demand cost of $10 per kilowatt (kW) per month;
- Pump operating time of 24 hours per day;
- Head losses of 22 ft of water (99.7 psi) and 14 ft of water (6.1 psi) for IX and GAC treatment trains, respectively; and
- Annual energy costs are based solely on head loss and do not reflect actual pumping costs.

Annual pumping costs related to media vessel head loss are:

- $2,265/GAC treatment train X 3 GAC treatment trains = $6,796; and
- $5,401/IX treatment train X 2 IX treatment trains = $10,802.

These costs were applied at the end of each year.

6.4.3 Media Disposal Costs

Typical spent media handling consists of regeneration, incineration, or land disposal.

Regeneration of adsorbent media is the process of removing contaminants from the media by the use of extreme temperatures, solvents, or brine solutions, so that the media may be reused for additional treatment. All IX resins used in this study are marketed as "single use" and are not intended for regeneration. Thermal regeneration (reactivation) is commonly applied to activated carbons. For the purposes of the LCCA, the cost of reactivation, storage of a "swing" load of GAC to be used in changeouts, freight, and service is assumed to be approximately 70% the cost of virgin GAC. Certain vendors including Calgon Carbon are currently reactivating GAC; however, as PFAS waste management becomes more highly regulated, there is the possibility that reactivation facilities may be challenged to meet PFAS air emissions and PFAS destruction requirements.

Incineration is a thermal waste treatment process that destroys substances by combustion. Incineration carries the risk of incomplete combustion and by-product generation (Stoiber et al., 2020). While incineration is relatively more common in the eastern United States, relatively few facilities are located near the west coast. The incineration facility that is located closest to the Los Angeles area is in Aragonite Incineration Facility located in Dugway, Utah. Because incineration is typically substantially more costly than land disposal and in the case of spent media from LHHCWD Well #10 would require considerable freight expense to transport it to the nearest facility, incineration is currently not the most cost-effective disposal method. For this reason, incineration was not considered for the LCCA.

Land disposal is the process of placing waste within engineered earthen burials. Because of the uncertain regulatory landscape with respect to PFAS, most waste disposal companies will only accept waste containing at PFAS at Class I hazardous waste landfills, where the waste can be placed in cells with closed-loop leachate containment systems. Of the three disposal options considered, land disposal is currently the most viable for disposal of single use IX resin. There is always the potential long-term liability related to land disposal of waste, should a hazardous waste landfill be required to take site mitigation actions due to unauthorized releases from the landfill. Disposal and waste freight costs in the LCCA were added whenever an IX changeout was to occur.

6.4.4 Freight Costs for Spent Media

The full-scale IX alternatives would require two IX treatment trains, which means that each changeout would require the transportation of approximately 29 cy or approximately 16.5 tons of IX resin (all IX resins have approximately the same density). If the media were transported in roll off bins with capacities of 18 tons and 16 cy, this means that an IX resin changeout would require two roll off bins.

6.5 Sensitivity Analysis

Sensitivity analysis was conducted due to the uncertainty of the estimation method used to predict PFOA breakthrough based linear extrapolation. This analysis was conducted by adjusting the estimated bed life up to ±30%. The results of this analysis for all tested media in terms of 2021 dollars per 1,000 gallons treated are shown in **Figure 10**.

The NPV over a 20-year life for the F400 GAC is approximately $3,214,000 of which approximately 65% is attributed to capital costs and 35% is attributed to O&M costs. This is equivalent to $0.13/1,000 gallons. When the bed life was adjusted by ±30%, the 20-year life cycle cost varied between approximately $0.12/1,000 gallons treated (77% cost decrease) and $0.15/1000 gallons treated (16% cost increase).

The NPV over a 20-year life for the AV1240LDX GAC is approximately $2,920,000 of which approximately 64% is attributed to capital costs and 36% is attributed to O&M costs. This is equivalent to $0.12/1,000 gallons. When the bed life was adjusted by ±30%, the 20-year life cycle cost varied between approximately $0.11/1,000 gallons treated (77% cost decrease) and $0.14/1,000 gallons treated (14% cost increase).

The NPV over a 20-year life for the PSR2 Plus IX resin is approximately $2,996,000 of which approximately 46% is attributed to capital costs and 54% is attributed to O&M costs. This is equivalent to $0.12/1,000 gallons treated. When the bed life was adjusted by ±30%, the 20-year life cycle cost varied between approximately $0.11/1,000 gallons treated (13% cost decrease) and $0.15/1,000 gallons treated (21% cost increase).

The NPV over a 20-year life for the PFCR-2 IX resin is approximately $3,083,000 of which approximately 43% is attributed to capital costs and 57% is attributed to O&M costs. This is equivalent to $0.13/1,000 gallons treated. When the bed life was adjusted by ±30%, the 20-year life cycle cost varied between approximately $0.11/1,000 gallons treated (12% cost decrease) and $0.16/1,000 gallons treated (23% cost increase).

Based on the sensitivity analysis, the GAC and IX alternatives are generally equally sensitive to uncertainties in the bed life estimates. This is in contrast to the findings for MTBLW Well #7, which showed that the GAC alternatives were more sensitive to changes in bed life than the IX alternatives (GSI, 2021). This observed difference appears to be driven by a couple of factors including:

- Longer bed lives for the tested GACs at LHHCWD Well #10 than at MTBLW Well #7; and
- Higher flow rates at LHHCWD Well #10 than at MTBLW Well #7 that necessitate more parallel operating treatment trains, which results in larger volumes of media per changeout.

The analysis of the GAC product performance at LHHCWD Well #10 should be qualified by the fact that there is relatively higher uncertainty with respect to bed life compared with the IX resins due to the length of the pilot test and the better than anticipated PFAS removal performance.

6.6 LCCA Summary and Evaluation of Alternatives

The following table summarizes the findings of the life cycle cost analyses for the two best performing GACs and IX resins:

Item	F400	AV1240LDX	PSR2 Plus	PFCR-2
Total Equipment & Installation Capital Costs*	$2,081,000	$1,876,000	$1,393,000	$1,323,000
20-Year Total O&M*	$1,379,000	$1,144,000	$1,968,000	$2,165,000
20-Year NPV*	$3,214,000	$2,920,000	$2,996,000	$3,083,000
Life Cycle Cost ($/1000 gallons)	$0.13	$0.12	$0.12	$0.13
Life Cycle Cost ($/acre-ft)	$43.31	$39.35	$40.38	$41.54

Notes

* Rounded to nearest $1,000.

A more detailed cost summary is provided in **Table 7** which also includes the results for the other four tested media. Based on the above analysis, GSI finds the AV1240LDX GAC to have the lowest NPV, slightly lower than the PSR2 Plus media by a narrow margin (differential NVP of $76,000). This evaluation is made based on the results of a pilot study that operated for 12

months and a life cycle cost assessment that considered both capital (equipment and media) and future O&M (media changeouts and differential electrical costs for pumping) costs over a 20-year life. An important caveat to this finding is the uncertainty with respect to the bed lives for the GAC products and the way the estimates were calculated. Midpoint sample results were increased by a factor of 1.5 to estimate bed lives for the design EBCT for the purposes of making a comparison. This scale-up factor appears to be supported by the observed differences between the bed lives for the half EBCT ("midpoint" column data) and design EBCT (effluent column data) found during the pilot test at MTBLW Well #7 (differences of 1.5 to 2) (GSI, 2021). Additionally, because the linear extrapolations used the steepest slopes that could be found in the partial breakthrough curves, this adds an additional level of conservatism. Together these two pieces of information suggest that the comparative cost estimates for the GACs in the range of 0 to -30% change in bed life should be representative for these products. However, because both sites have different source water qualities (e.g., minor differences in PFAS concentrations, likely differences in DOC/TOC characteristics, etc.), the ultimate bed lives for the GAC products would need to be confirmed by additional testing.

This analysis did not include additional costs for site-specific work such as concrete pads, electrical, instrumentation and controls setup, etc. or other O&M activities such as GAC backwashing (equipment and well downtime) or system maintenance. Most of these costs are anticipated to be similar between GAC and IX alternatives, however backwashing of GAC vessels would be anticipated to only apply to the GAC alternative (vendors do not recommend backwashing IX). This would result in added costs to the GAC alternative in the form of additional equipment (backwash tank, pump, and plumbing) and labor.

7.0 CONCLUSIONS AND LESSONS LEARNED

A summary of the conclusions, recommendations, and lessons learned generated from the pilot test are as follows:

1. PFOA breakthrough is predicted to be the main driver for media changeouts at LHHCWD Well #10. Although the removal efficiency of short-chain PFAS is typically lower than for PFOA, PFOA's RL is currently the lowest of all PFAS with current health-based advisory levels for drinking water. The main driver could change as PFAS regulations evolve or if the source water concentrations change.
2. Breakthrough duration, from initial to target threshold concentration (PFOA RL), tended to be gradual for PFOA, with the shortest breakthrough duration being approximately 15,000 bed volumes for PFOA through AV1240LDX, which is anticipated to be approximately 3.5 months at full scale. This would allow for operators to sample relatively infrequently (once per month) and still be able to maximize utilization of media adsorption capacity for PFOA and changeout media prior to complete breakthrough.
3. Perfluorocarboxylic acids tended to breakthrough before perfluorosulfonic acids, with short-chain PFAS generally eluting earlier than long-chain PFAS.
4. TOC and DOC were reported in well water samples at approximately 1 mg/L, which may have affected GAC efficiency for PFAS removal. The overall impact of TOC/DOC on PFAS removal efficiency remains unclear due to the fact that PFOA did not start being detectable in effluent samples until the end of the pilot test (12 months). This contrasts the performance of the same GAC products at the MTBLW Well #7 pilot test which had faster breakthrough with similar levels of TOC and DOC (GSI, 2021). Source water with lower TOC concentrations may result in more efficient GAC performance, however others have pointed out that it is not only the quantity but the characteristics of the organic carbon

that may be important for PFAS adsorption interference (Park et al., 2020). Future pilot tests at other sites may choose to test source water for TOC and DOC to assess GAC's tendency for removing TOC and DOC, reducing bed life for target contaminants.

5. PSR2 Plus had the longest time to break through compared to other resins. While not confirmed, the difference in performance may be in part due to less impact from background sulfate as less sulfate was likely removed by PSR2 Plus than other resins based on results from a similar pilot study (Jacobs, 2021).
6. The relative influent concentrations and adsorption affinities of PFAS compounds affect the overall elution behavior. Chromatographic peaking, a phenomenon where effluent concentrations exceed influent concentrations due to displacement of adsorbed contaminant mass by compounds with higher adsorption affinities, was observed through GACGAC column effluent samples for PFBS. While monitoring of lead-vessel concentrations and the existence of a lag media vessel would ensure that high concentrations of PFAS were not discharged from an adsorption system, changes in influent PFAS concentrations should be monitored because they could affect overall removal performance of key PFAS constituents.
7. Although breakthrough to the RL for PFOA was not achieved for three of the GACs, even conservative estimates of bed lives using linear extrapolations of the steepest, early breakthrough curve slopes showed that GAC is cost competitive with IX resin for LHHCWD Well #10.
8. The frequency of changing the pilot test pretreatment cartridge filter indicates that pretreatment costs, such as a bag filter pretreatment system, will need to be considered for any pumpers requiring wellhead treatment.
9. The PSR2 Plus IX resin appeared to have the largest PFOA removal capacity of the four IX resins tested.
10. The reagglomerated carbon (Calgon F400) appears to have outperformed the direct-activated carbons in the pilot test in terms of time to PFOA breakthrough at the RL of 10 ng/L based on midpoint samples.
11. Capital costs tend to differ significantly between GAC and IX alternatives for 20-year life cycles with differences in NPV ranging from approximately $400,000 to $700,000, which is attributed to the increased equipment (more treatment trains) and media (additional "swing loads") costs for the GAC alternative.
12. The AV1240LDX GAC was found to narrowly be the most economical media tested based on pilot study results and the 20-year life cycle cost analysis. The PSR2 Plus IX resin was found to be cost competitive with the AV1240LDX with a 20-year NPV differential of $76,000.
13. All media alternatives generally had similar sensitivities to perturbations in the estimated bed life.
14. Despite differences in bed life performance for PSR2 Plus (~540,000 bed volumes) and PFCR-2 (440,000 bed volumes) IX resins, they are similar in terms of O&M costs due to different unit costs ($275/ft^3 and $235/ft^3, respectively).
15. In addition to GAC treatment of PFOA appearing to be slightly more economical than IX treatment for the water tested at the design flow rate of 2,300 gpm, GAC systems may also be more useful than IX if the groundwater contains other contaminants. For example, groundwater that contains both VOCs and PFAS may use a GAC system for treatment of both compounds. Similarly, groundwater that contains both PFAS and perchlorate may be able to use IX treatment more effectively depending on the choice of resin. However, competing compounds may affect the efficiency of PFAS removal by both GAC and IX, so

groundwater containing additional contaminants (e.g., higher TOC and possibly sulfate depending on resin) may increase the changeout frequencies predicted in this report. Lastly, additional analysis would need to be conducted to evaluate how life cycle costs would scale with increasing design flow rate.

16. If the area available for a wellhead treatment system is limited, a smaller footprint IX treatment system may be more favorable as compared to a GAC treatment system.

06/03/2021		x		x	
06/20/2021		x		x	x

Notes:

1. Weekly sample set consisted of PFAS and general water quality parameters listed in Table 2
2. Monthly influent sample set consisted of general water quality parameters, metals, volatile organic compounds are listed in Table 3
3. Midpoint samples were collected at approximately 50% and 32% of the bed volumes for GAC and IX columns, respectively

Abbreviations:

LHHCWD = La Habra Heights County Water District
PFAS = Per- and polyfluoroalkyl substances
TOC = Total organic carbon
DOC = Dissolved organic carbon
GAC = Granular activated carbon
IX = Ion exchange
x = Sample location/sample set collected and analyzed

Notes:
1. La Habra Heights County Water District Well #10 (WRD ID = 202830)
2. Only PFAS compounds with detections in the 2020-2021 Treatment Pilot Study samples are shown in this table. Samples were analyzed for 18 PFAS compounds in total.
3. Historic sample results prior to 2020 are provided by WRD.

Abbreviations:
PFAS = Per- and polyfluoroalkyl substances
ng/L = nanograms per liter
mg/L = milligrams per liter
$CaCO_3$ = calcium carbonate
NO_3 = nitrate
WRD = Water Replenishment District
LHHCWD = La Habra Heights County Water District
J = detection is estimated
< = not detected at or above the reporting limit shown

Notes:

1. La Habra Heights County Water District Well #10 (WRD ID = 202830)
2. Only PFAS compounds with detections in the 2020-2021 Treatment Pilot Study influent samples are shown in this table. Samples were analyzed for 18 PFAS compounds in total.

Abbreviations:

PFAS = Per- and polyfluoroalkyl substances
ng/L = nanograms per liter
GAC = granular activated carbon
M = midpoint sample
LHHCWD = La Habra Heights County Water District
< = not detected at or above the reporting limit shown

Notes:
1. La Habra Heights County Water District Well #10 (WRD ID = 202830)
2. Only PFAS compounds with detections in the 2020-2021 Treatment Pilot Study influent samples are shown in this table. Samples were analyzed for 18 PFAS compounds in total.

Abbreviations:
PFAS = Per- and polyfluoroalkyl substances
ng/L = nanograms per liter
IX = ion exchange
M = midpoint sample
LHHCWD = La Habra Heights County Water District
< = not detected at or above the reporting limit shown

Abbreviations:

LHHCWD = La Habra Heights County Water District
MGD = million gallons per day
gpm = gallons per minute
lbs = pounds
gal = gallons
BV = Bed Volume
EBCT = empty bed contact time
ft^3 = cubic feet

Notes:

1. A tax rate of 10% was applied to equipment and virgin media (not applied to reactivated media).
2. The unit cost for changeout GAC is assumed to be approximately 70% of the virgin GAC cost and includes service fees, warehousing of "swing loads," and reactivation. The IX unit cost is for virgin material. Both unit costs include freight.
3. The interest rate is assumed to be 3% and the discount rate is assumed to be 5%.

The design flow rate is 2,300 gpm.
Changeout trigger is assumed to be the PFOA response level (RL).

Ion Exchange and Carbon Media Manufacturers' Specifications

AV 1240 Coal Base Granular Activated Carbon

Application:

This activated carbon is made from bituminous coal. This type is mainly used for purification of ground water, well water, treating water for industrial water treatment, waste water treatment, decolorizing, deodorizing and recycling water systems. This Coal Base Activated Carbon meets NSF-61 for treatment of potable water and all municipal water treatment use.

Specification:

		Test Methods
Mesh Size	12 x 40 Larger than #12, 5% max Smaller than #40, 4% max	ASTM D2862
Effective Size:	0.55-0.75 mm	
Uniformity Coefficient:	1.9 max	
Moisture Content	5% max	
Hardness	90% min	ASTM D3802
Abrasion Number	80	AWWA-B604
Iodine No.	900-1000 mg/gm	ASTM D4607
Density	0.46-0.54 g/cc	ASTM D2864

Packaging:

Standard Packaging: 28 or 55 lb polypropylene bags, 200 lb fiber drums, and 1100 lb,. super sacks are available.

Notes:

The above specification can be adjusted in accordance with the customer's requirements.

AV1240 LDX Granular Activated Carbon

Application:

AV1240 LDX is a virgin granular activated carbon produced from coal through a proprietary high-temperature activation process under stringent quality control.

- Designed for many liquid phase applications to remove small and large organic molecules such as color bodies, TOC, and other impurity compounds
- Well suited for removal of perfluoroalkyl substances such as PFOS and PFOA from water
- Applicable to glycerin decolorizing and purification
- High adsorption capacity
- Meets US Food Chemicals Codex (FCC) standards
- Certified to ANSI / NSF 61

Specification:

		Test Methods
Mesh Size	12 x 40 Larger than #12, 5% max Smaller than #40, 5% max	ASTM D2862
Moisture Content	5% max	
Hardness	93% min	ASTM D3802
Abrasion Number	Min. 75	AWWA-B604
Iodine No.	Min 1000 mg/gm	ASTM D4607
Density	0.36-0.44 g/cc	ASTM D2864

Packaging:

Standard packing is 44 lb. bags or 880 lb. bulk sacks.

Notes:

The above specification can be adjusted in accordance with customer's requirements.

AV1240 PFAS Granular Activated Carbon

Application:

AV1240 PFAS is a granular activated carbon designed for treatment of drinking water in municipal applications. The manufacturing process used creates an activated carbon with enhanced properties making it ideal for the removal of contaminants including: disinfection byproduct precursors (DBPs), perfluorinated compounds (PFCs), pesticides, as well as naturally occurring organic matter and compounds affecting taste and odor. AV1240 PFAS is ANSI/NSF61 Certified.*

Specification:

		Test Methods
Mesh Size	12 x 40 Larger than #12, 5% max Smaller than #40, 4% max	ASTM D2862
Effective Size:	0.55-0.75 mm	
Uniformity Coefficient:	1.7 max	
Moisture Content	5% max	
Hardness	93% min	ASTM D3802
Abrasion Number	Min. 75	AWWA-B604
Iodine No.	Min 1000 mg/gm	ASTM D4607
Density	Min. 0.43 g/cc	ASTM D2864

Packaging:

Standard Packaging: 55 lb polypropylene bags and 1100 lb., super sacks are available.

Notes:

The above specification can be adjusted in accordance with the customer's requirements.

FILTRASORB® 400

Granular Activated Carbon

Applications

FILTRASORB 400 activated carbon can be used in a variety of liquid phase applications for the removal of dissolved organic compounds. FILTRASORB 400 has been successfully applied for over 40 years in applications such as drinking and process water purification, wastewater treatment, and food, pharmaceutical, and industrial purification.

Description

FILTRASORB 400 is a granular activated carbon for the removal of dissolved organic compounds from water and wastewater as well as industrial and food processing streams. These contaminants include taste and odor compounds, organic color, total organic carbon (TOC), industrial organic compounds such as TCE and PCE, and PFAS.

This activated carbon is made from select grades of bituminous coal through a process known as reagglomeration to produce a high activity, durable, granular product capable of withstanding the abrasion associated with repeated backwashing, hydraulic transport, and reactivation for reuse. Activation is carefully controlled to produce a significant volume of both low and high energy pores for effective adsorption of a broad range of high and low molecular weight organic contaminants.

FILTRASORB 400 is formulated to comply with all the applicable provisions of the AWWA Standard for Granular Activated Carbon (B604) and Food Chemicals Codex. This product may also be certified to the requirements of ANSI/NSF Standard 61 for use in municipal water treatment facilities. Only products bearing the NSF Mark are certified to the NSF/ANSI 61 - Drinking Water System Components - Health Effects standard. Certified Products will bear the NSF Mark on packaging or documentation shipped with the product.

Features / Benefits

- Produced from a pulverized blend of high quality bituminous coals resulting in a consistent, high quality product.
- Carbon granules are uniformly activated through the whole granule, not just the outside, resulting in excellent adsorption properties and constant adsorption kinetics.
- The reagglomerated structure ensures proper wetting while also eliminating floating material.
- High mechanical strength relative to other raw materials, thereby reducing the generation of fines during backwashing and hydraulic transport.
- Carbon bed segregation is retained after repeated backwashing, ensuring the adsorption profile remains unchanged and therefore maximizing the bed life.
- Reagglomerated with a high abrasion resistance, which provides excellent reactivation performance.
- High density carbon resulting in a greater adsorption capacity per unit volume.

Specifications[1]	FILTRASORB 400
Iodine Number, mg/g	1000 (min)
Moisture by Weight	2% (max)
Effective Size	0.55–0.75 mm

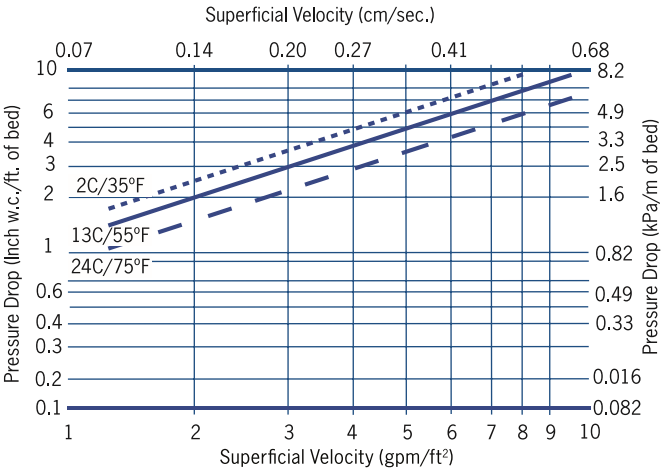
Safety Message

Wet activated carbon can deplete oxygen from air in enclosed spaces. If use in an enclosed space is required, procedures for work in an oxygen deficient environment should be followed.

DS-FILTRA40017-EIN-E1

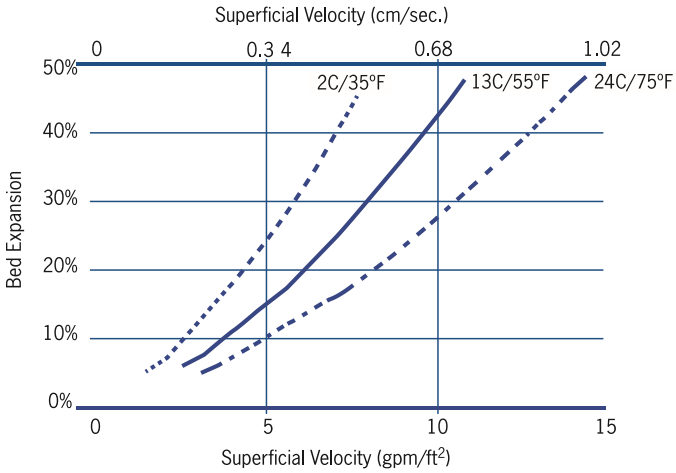
Typical Pressure Drop

Based on a backwashed and segregated bed



Typical Bed Expansion During Backwash

Based on a backwashed and segregated bed



Design Considerations

FILTRASORB 400 activated carbon is typically applied in down-flow packed-bed operations using either pressure or gravity systems. Design considerations for a treatment system is based on the user's operating conditions, the treatment objectives desired, and the chemical nature of the compound(s) being adsorbed.

Safety Message

Wet activated carbon can deplete oxygen from air in enclosed spaces. If use in an enclosed space is required, procedures for work in an oxygen deficient environment should be followed.

DS-FILTRA40017-EIN-E1

Product Data Sheet

DOWEX™ PSR2 Plus Cl Ion Exchange Resin

For Selective Removal of Perchlorate from Potable Water

Description

DOWEX™ PSR2 Plus Cl Ion Exchange Resin is a strong base anion exchange resin for the selective removal of perchlorate from potable water.

Designed to offer exceptional selectivity for perchlorate, the gel matrix also helps achieve high capacity while the uniform particle size (UPS) allows operation at lower pressure losses compared to conventional perchlorate removal resins.

Typical Physical and Chemical Properties

Matrix	Styrene-divinylbenzene, gel
Type	Strong base anion
Physical Form	White to yellow spherical beads
Ionic Form as Shipped	Cl^- Form
Total Exchange Capacity	≥ 0.7 eq/L
Water Retention Capacity	25 – 35%
Particle Size	
Particle Diameter [b]	700 ± 50 µm
Uniformity Coefficient	≤ 1.1
< 300 µm	1% max
Particle Density	1.07 g/mL
Bulk Density, as Shipped [c]	690 g/L (43 lb/ft^3)

[b] For additional particle size information, please refer to the Particle Size Distribution Cross Reference Chart (Form No. 177-01775).
[c] As per the backwashed and settled density of the resin, determined by ASTM D-2187.

Form No. 177-03587, Rev. 1
May 2016

Suggested Operating Conditions

Maximum Operating Temperature	60°C (140°F)
pH Range	0 – 14
Bed Depth, min.	1000 mm (3.1 ft)
Typical Service Flowrate	4 – 64 BV*/h (0.5 – 8 gpm/ft^3)
Typical Linear Velocity	12 – 54 m/h (5 – 22 gpm/ft^2)

* 1 BV (Bed Volume) = 1 m^3 solution per m^3 resin or 7.5 gal per ft^3 resin

Please contact your Dow representative for system design and application testing details.

Commissioning and Limits of Use

DOWEX™ PSR2 Plus Cl Resin is suitable for use in potable water applications after an initial commissioning pretreatment at ambient temperature.

Note

These resins may be subject to drinking water application restrictions in some countries.

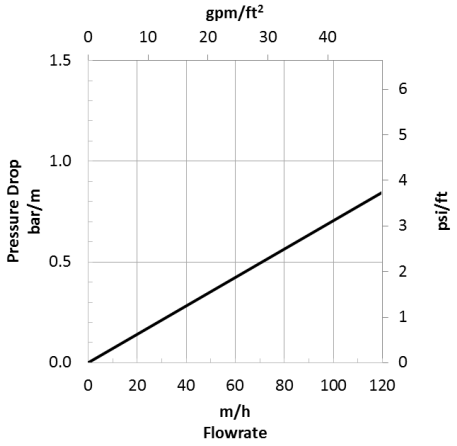
Please check the application status before use and sale.

Hydraulic Characteristics

Pressure drop data for DOWEX™ PSR2 Plus Cl Resin as a function of service flowrate at 20°C (68°F) is shown in Figure 1. The pressure drop for other water temperatures can be calculated with the provided equations. Pressure drop data are valid at the start of the service run with clean water and a correctly classified bed.

Figure 1: Pressure Drop

Temperature = 20°C (68°F)



For other temperatures use:
$P_T = P_{20°C} / (0.026\ T_{°C} + 0.48)$, where P ≡ bar/m
$P_T = P_{68°F} / (0.014\ T_{°F} + 0.05)$, where P ≡ psi/ft

Packaging

- 5-ft^3 (0.14-m^3) fiber drums
- 1000-L (264-gal) super sacks

Product Stewardship

Dow has a fundamental concern for all who make, distribute, and use its products, and for the environment in which we live. This concern is the basis for our product stewardship philosophy by which we assess the safety, health, and environmental information on our products and then take appropriate steps to protect employee and public health and our environment. The success of our product stewardship program rests with each and every individual involved with Dow products—from the initial concept and research, to manufacture, use, sale, disposal, and recycle of each product.

Customer Notice

Dow strongly encourages its customers to review both their manufacturing processes and their applications of Dow products from the standpoint of human health and environmental quality to ensure that Dow products are not used in ways for which they are not intended or tested. Dow personnel are available to answer your questions and to provide reasonable technical support. Dow product literature, including safety data sheets, should be consulted prior to use of Dow products. Current safety data sheets are available from Dow.

WARNING: Oxidizing agents such as nitric acid attack organic ion exchange resins under certain conditions. This could lead to anything from slight resin degradation to a violent exothermic reaction (explosion). Before using strong oxidizing agents, consult sources knowledgeable in handling such materials.

RESINTECH INC.
INNOVATIONS IN ION EXCHANGE

SIR-110-HP

ANION EXCHANGE RESIN
PFAS, NITRATE & PERCHLORATE SELECTIVE
CI FORM

RESINTECH SIR-110-HP is a chloride form PFAS, nitrate and perchlorate selective strong base anion resin. *SIR-110-HP* has unique functionality that greatly increases selectivity for nitrate while greatly decreasing the interference from sulfate ions. *RESINTECH SIR-110-HP* has the highest possible selectivity for perchlorate when compared to other similar resins. *SIR-110-HP* is intended for all perchlorate and PFAS removal applications, and where the highest possible affinity for nitrate is desired. SIR-110-HP is supplied in the chloride form.

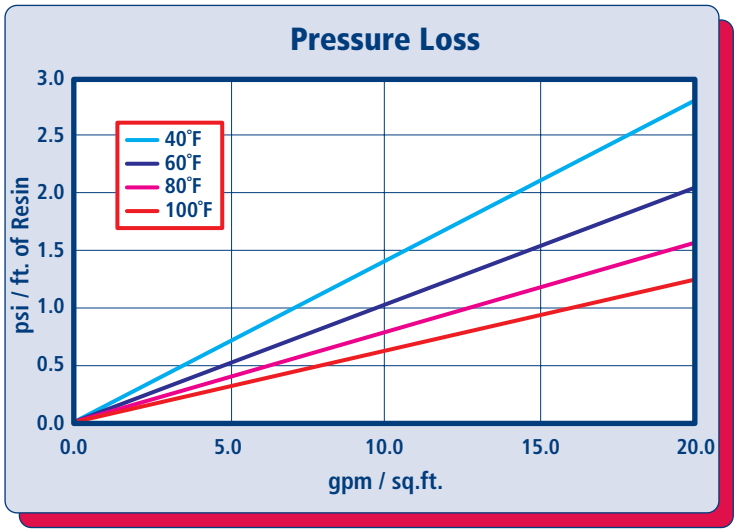
C US
NSF/ANSI-61 CERTIFIED FOR MATERIAL SAFETY

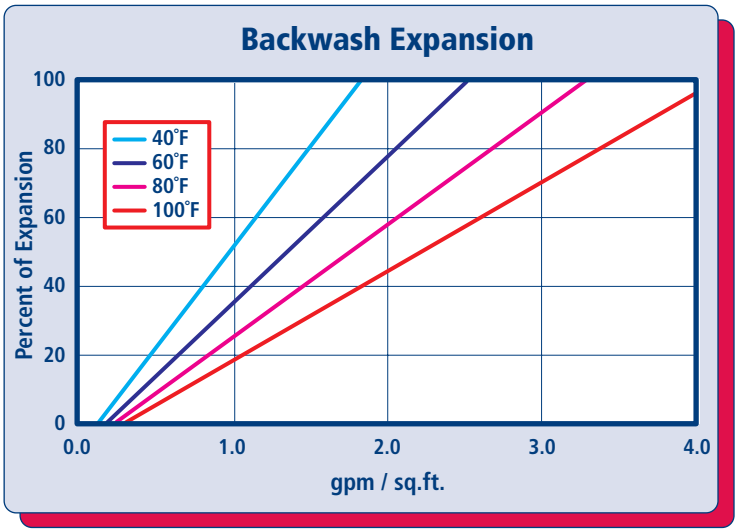
FEATURES & BENEFITS

- **HIGHEST OPERATING CAPACITY OF ANY PERCHLORATE AND PFAS SELECTIVE RESIN**
  Highly selective for perchlorate, PFAS and nitrate
- **LOW SULFATE SELECTIVITY**
  The unique functional group eliminates the possibility of nitrate dumping
- **SUPERIOR PHYSICAL STABILITY**
  90% plus sphericity and high crush strengths together with carefully controlled particle distribution provides long life and low pressure drop
- **CONTROLLED PARTICLE SIZE**
  16 to 50 mesh size provides a low pressure drop and superior kinetics

NSF/ANSI-61 compliance requires conditioning with a minimum 20 bed volume rinse prior to first use.

HYDRAULIC PROPERTIES





PRESSURE LOSS

The graph above shows the expected pressure loss of *ResinTech SIR-110-HP* per foot of bed depth as a function of flow rate at various temperatures.

BACKWASH

The graph above shows the expansion characteristics of *ResinTech SIR-110-HP* as a function of flow rate at various temperatures.

RESINTECH® SIR-110-HP

PHYSICAL PROPERTIES

Polymer Structure	Styrene/DVB
Functional Group	Tributylamine
Physical Form	Spherical beads
Ionic Form as shipped	Chloride
Total Capacity	
Chloride form	>0.7 meq/mL
Water Retention	
Chloride form	38 to 50 percent
Approximate Shipping Weight	
Chloride form	41 lbs./cu.ft.
Screen Size Distribution (U.S. mesh)	20 to 50
Maximum Fines Content (<50 mesh)	1.5 percent
Minimum Sphericity	90 percent
Uniformity Coefficient	1.6 approx.
Resin Color	White to tan

Note: Physical properties can be certified on a per lot basis, available upon request

SUGGESTED OPERATING CONDITIONS

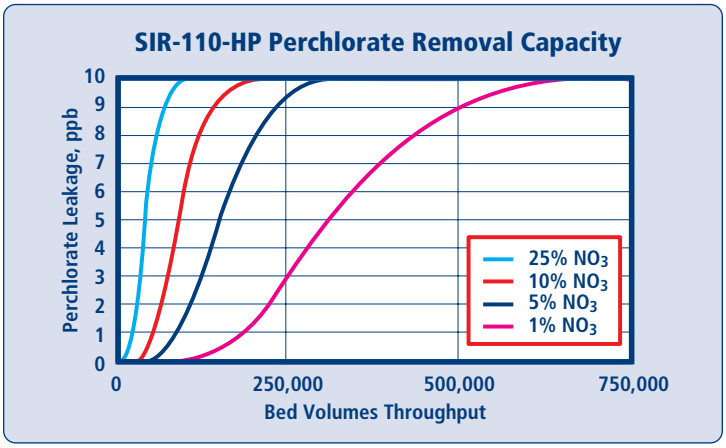
Maximum continuous temperature	
Chloride form	170˚F
Minimum bed depth	24 inches
Backwash expansion	25 to 50 percent
Maximum pressure loss	20 psi
Operating pH range	4 to 10 SU
Regenerant Concentration	
Salt cycle	5 to 10 percent NaCl
Regenerant level	>10 lbs./cu.ft.
Regenerant flow rate	0.25 to 1.0 gpm/cu.ft.
Regenerant contact time	>30 minutes
Displacement flow rate	Same as dilution flow
Displacement volume	10 to 15 gallons/cu.ft.
Rinse flow rate	Same as service flow
Rinse volume	35 to 60 gallons/cu.ft.
Service flow rate	1 to 3 gpm/cu.ft.

Note: These guidelines describe average low risk operating conditions. They are not intended to be absolute minimums or maximums.
For operation outside these guidelines, contact ResinTech Technical Support

APPLICATIONS

PFAS REMOVAL

ResinTech SIR-110-HP can be used for removal of various PFAS compounds, including PFOA and PFOS, from water. Testing has shown it can remove a wide range of other PFAS species in addition to these compounds. Ion exchange offers the benefit of reduced contact times and longer throughputs vs. conventional activated carbon treatment. An understanding of the influent water chemistry is needed for thorough review. Levels of TOC, VOC and individual PFAS compounds are needed in addition to the basic background water chemistry (chloride, sulfate, alkalinity, etc.). Any other contaminants that may be present are also needed to determine impact on PFAS removal (uranium, perchlorate, chromate, arsenic, etc.).



Capacity chart is based on waters with inlet conditions of 10 ppb ClO_4, TDS less than 500 ppm, and is for perchlorate alone, exclusive of other anions. No engineering downgrade has been applied.

PERCHLORATE REMOVAL

ResinTech SIR-110-HP is ideal for single use perchlorate removal applications and is a cost effective method to remove trace levels of perchlorate from water. The perchlorate ion is very strongly attracted to the ResinTech SIR-110-HP, so much so that regeneration is impractical or impossible. However, in most cases perchlorate loads to almost the full capacity of the resin, resulting in very long service life and eliminating the need to regenerate and re-use the spent resin.

NITRATE REMOVAL

RESINTECH SIR-110-HP can be used in the chloride form to remove nitrates as well as perchlorates from potable water. SIR-110-HP has higher capacity for nitrate than SIR-100-HP in high TDS waters. When treating waters with high hardness the brine dilution and displacement waters should be softened and a low hardness salt used to prevent scaling. Regeneration, although possible, can be complicated, and may require special brining techniques or brine dosages.

PRODUCT DATA SHEET

Purofine®
PFA694E

Polystyrenic Gel, Potable Water Grade

PRINCIPAL APPLICATIONS

- Removal of perfluoroalkyl substances
- Removal of polyfluoroalkyl substances

ADVANTAGES

- Very high operating capacity
- Excellent kinetics

SYSTEMS

- Point of Use Systems (POU)
- Point of Entry Systems (POE)
- Municipal

REGULATORY APPROVALS

- Certified by the WQA to NSF/ANSI-61 Standard

TYPICAL PACKAGING

- 1 ft³ Sack
- 25 L Sack
- 5 ft³ Drum (Fiber)
- 1 m³ Supersack
- 42 ft³ Supersack

** Reduces PFAS to non-detect levels ranging from 1 – 5 parts per trillion*

TYPICAL PHYSICAL & CHEMICAL CHARACTERISTICS:

Polymer Structure	Polystyrene crosslinked with divinylbenzene
Appearance	Spherical Beads
Functional Group	Complex Amino
Mean Diameter	675 ± 75 µm
Uniformity Coefficient (max.)	1.3
Specific Gravity	1.05
Shipping Weight (approx.)	650 - 700 g/L (40.6 - 43.8 lb/ft³)
Temperature Limit	100 °C (212.0 °F) (Cl^- form)
Temperature Limit	60 °C (140.0 °F) (OH^- form)

Hydraulic Characteristics

PRESSURE DROP

The pressure drop across a bed of ion exchange resin depends on the particle size distribution, bed depth, and voids volume of the exchange material, as well as on the flow rate and viscosity of the influent solution. Factors affecting any of these parameters—such as the presence of particulate matter filtered out by the bed, abnormal compressibility of the resin, or the incomplete classification of the bed—will have an adverse effect, and result in an increased head loss. Depending on the quality of the influent water, the application and the design of the plant, service flow rates may vary from 10 to 40 BV/h.

BACKWASH

During up-flow backwash, the resin bed should be expanded in volume between 50 and 70% for at least 10 to 15 minutes. This operation will free particulate matter, clear the bed of bubbles and voids, and reclassify the resin particles ensuring minimum resistance to flow. When first putting into service, approximately 30 minutes of expansion is usually sufficient to properly classify the bed. It is important to note that bed expansion increases with flow rate and decreases with influent fluid temperature. Caution must be taken to avoid loss of resin through the top of the vessel by over expansion of the bed.

PRESSURE DROP ACROSS RESIN BED

Resinex™
Ion Exchange Resin

Resinex™ PFCR-2

Selective PFOA/PFOS removal ion exchange resin

Resinex™ PFCR-2 is a food grade, high purity, premium grade, strongly basic gel-type anion exchange resin, specially developed for selective perfluroinated compound removal from potable water in presence of high levels of sulphate. Resinex™ PFCR-2 offers a superior operating capacity and an excellent selectivity to PFOA and PFOS compounds for economical treatment in co-flow and counter-flow systems. Resinex™ PFCR-2 is implemented where the removal of monovalent ions are necessary. Resinex™ PFCR-2 is also suitable for nitrate removal applications. This resin is suggested to be implemented as a one time use application and not suggested to be regenerated.

Typical Properties

Type	Crosslinked polystyrene divinylbenzene
Form	gel, amber, spherical beads
Functional group	Tributylamine
Whole bead count	95% min.
Ionic form, as shipped	Cl^-
Bead size	(≥ 95%) 0.30 - 1.25 mm (16x50 mesh)
Uniformity coefficient	1.70 max.
Bulk density, as shipped	650 - 700 kg/m^3
Real density	1.00 - 1.10 g/cm^3
Water retention	37 - 43%
Total capacity (Cl^- form)	0.70 eq/l min.
Stability, temperature	100°C (Cl^- Form) max.
Stability, pH	0 - 14

Standard Design Conditions

Bed depth	> 750 mm
Service flow rate	8 - 40 BV/h
Backwash expansion	50 - 75%

Key Features and Benefits

- **High Integrity Beads**
  Excellent resistance to mechanical degradation ensures low pressure drop
- **High Selectivity To PFOA/PFOS**
  To comply with local legislation
- **High Operating Capacity**
  Economical advantage
- **Pretreated - Direct Usage In Cartridges**
  Point-of-entry and Point-of-use

Typical Applications

- PFOA removal
- PFOS removal

Standard Packaging

- 25 liter / 1 CFT PE valve bag
- 1000 litre bulk bag
- 2, 5 or 7 CFT drums

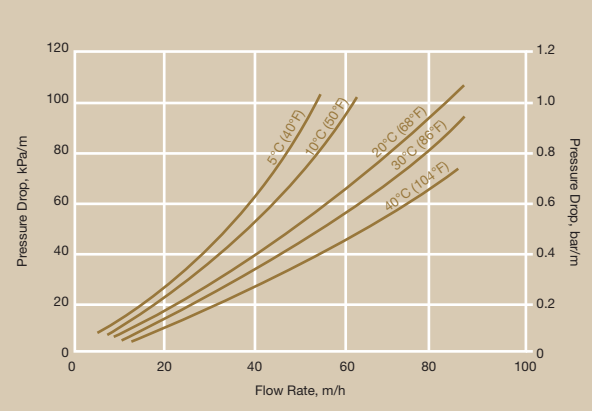
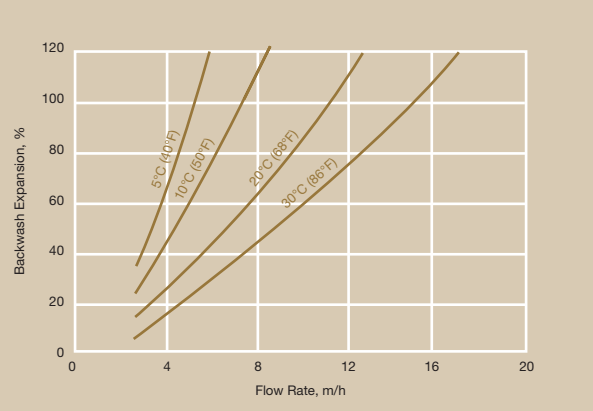
Resinex™ PFCR-2

Selective PFOA/PFOS removal ion exchange resin

Pressure Drop



Backwash Expansion



Standard Regeneration Parameters

Regeneration	Co-Flow
Concentration	5-10% NaCl
Level	150-200 g/l
Flow rate regenerant	4-6 BV/h
Contact time regenerant	30-60 min.
Flow rate rinse	2-6 BV/h
Rinse water required	2 BV

Product Packing

25 lit. polyethylene valve bag
48 bags per pallet

Polypropylene FIBCs
(big bag), 1.000 lit.

CAUTION Strong oxidizing agents such as nitric acid can react violently with ion exchange resins and cause explosive type reactions. Before using strong oxidants, consult sources knowledgeable in the handling of these materials.

* Effective May 4, 2020 EEAM Lab is A2LA accredited for ISO/IEC 17025:2017.
* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 846702

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = 6168 (Observation= 14.2 °C) (Corr.Factor -0.2 °C) (Final = 14.0 °C)

TYPE OF ICE: Real X Synthetic ____ No Ice ____ CONDITION OF ICE: Frozen X Partially Frozen ____ Thawed ____ N/A ____

METHOD OF SHIPMENT: Pick-Up (Walk-In) / FedEx / UPS / DHL / Area Fast / Top Line / Other: ____

Compliance Acceptance Criteria:

1) **Chemistry:** >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) **Microbiology, Distribution:** < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) **Microbiology, Surface Water:** < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	2 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)
3 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	4 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)

4 **Dioxin (1613 or 2,3,7,8 TCDD):** must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) **pH Check.** Manufacturer: ____ Lot Number: ____ pH strip type: 0 - 14 or ____ Expiration Date ____ Results: ____

6) **Chlorine check.** Manufacturer: Sansafe. Lot No.: ____ Expiration Date: ____ Results ____

7) VOA Headspace: No Samples with Headspace: [X] Samples with Headspace (see below): [ ]

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Samp ID	Bottle #	None/<6 mm	>6mm

Samp ID	Bottle #	None/<6 mm	>6mm

Samp ID	Bottle #	None/<6 mm	>6mm

Samp ID	Bottle #	None/<6 mm	>6mm

Note Sample IDs which have dissimilar headspace (i.e. potential sampling errors): ____

Folder Comments

Analytical results for Oil and Grease are submitted by Eurofins Calscience in Garden Grove, CAELAP 2944 exp 9-30-2020

Flags Legend:

LM - MRL Check recovery was above laboratory acceptance limits. This target analyte was not detected in the sample.

M1 - Matrix spike recovery was high; the associated blank spike recovery was acceptable.

The Comments Report may be blank if there are no comments for this report.

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Alkalinity in CaCO3 units by SM 2320B

Analytical Batch: 1246155

Analysis Date: 05/04/2020

LCS1	Alkalinity in CaCO3 units		100	98.9	mg/L	99	(90-110)		

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 4/27/2020 11:55 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.8º C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 846702

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = 6166B (Observation= 14.2 °C) (Corr.Factor -0.2 °C) (Final = 14.0 °C)

TYPE OF ICE: Real X Synthetic ____ No Ice ____ CONDITION OF ICE: Frozen X Partially Frozen ____ Thawed ____ N/A ____

METHOD OF SHIPMENT: Pick-Up (Walk-In) / FedEx / UPS / DHL / Area Fast / Top Line / Other: ____

Compliance Acceptance Criteria:

1) **Chemistry:** >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) **Microbiology, Distribution:** < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) **Microbiology, Surface Water:** < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 - (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	2 - (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)
3 - (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	4 - (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)

4 Dioxin (1613 or 2,3,7,8 TCDD): must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) **pH Check.** Manufacturer: ____ Lot Number: ____ pH strip type: 0 - 14 or ____ Expiration Date ____ Results: ____

6) **Chlorine check.** Manufacturer: Sansafe. Lot No.: ____ Expiration Date: ____ Results ____

7) **VOA Headspace:** **No Samples with Headspace:** [X] **Samples with Headspace (see below):** [ ]

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	Preservation labels on samples match COC
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Report: 869296
Project: 0250000
Group: WRD Pilot [Set #2]

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 869296

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = 6168 (Observation= 12.3 °C) (Corr.Factor -0.2 °C) (Final = 12.1 °C)

TYPE OF ICE: Real X Synthetic ____ No Ice ____ CONDITION OF ICE: Frozen ____ Partially Frozen X ____ Thawed ____ N/A ____

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: ____

Compliance Acceptance Criteria:

1) Chemistry: >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) Microbiology, Distribution: < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) Microbiology, Surface Water: < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	2 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)
3 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	4 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)

4 Dioxin (1613 or 2,3,7,8 TCDD): must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) pH Check. Manufacturer: ____ Lot Number: ____ pH strip type: 0 - 14 or ____ Expiration Date ____ Results: ____

6) Chlorine check. Manufacturer: Sansafe. Lot No.: ____ Expiration Date: ____ Results ____

7) VOA Headspace: No Samples with Headspace: ☐ Samples with Headspace (see below): ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Project Manager

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 376644

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = 6301 (Observation= 8.6 °C) (Corr.Factor 0.2 °C) (Final = 8.4 °C)

TYPE OF ICE: Real / Synthetic _____ No Ice _____ CONDITION OF ICE: Frozen / Partially Frozen _____ Thawed _____ N/A _____

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: _____

Compliance Acceptance Criteria:

1) **Chemistry:** >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) **Microbiology, Distribution:** < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) **Microbiology, Surface Water:** < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)	2 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)
3 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)	4 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)

4 **Dioxin (1613 or 2,3,7,8 TCDD):** must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) **pH Check.** Manufacturer: _____ Lot Number: _____ pH strip type: 0 - 14 or _____ Expiration Date _____ Results: _____

6) **Chlorine check.** Manufacturer: Sansafe. Lot No.: _____ Expiration Date: _____ Results _____

7) VOA Headspace: **No Samples with Headspace:** ☐ **Samples with Headspace (see below):** ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Folder Comments

N1 -LCS1 recovery for PFTA was slightly above the above method acceptance limits. LCS 2 was at 104 % recovery .LCS1/LCS2 RPD is acceptable. All other Batch QCs are acceptable. This target analyte was not detected in the sample. ND results are acceptable for compliance.

Flags Legend:

N1 - See case narrative.

The Comments Report may be blank if there are no comments for this report.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Report: 871876
Project: 0250000
Group: WRD Pilot [Set #2]

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report,
Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.

Kit Order for Water Replenishment District

Sophia F Liang is your Eurofins Eaton Analytical, LLC Service Manager

750 Royal Oaks Drive, Suite 100
Monrovia, California 91016-3629
(626) 386-1100 FAX (866) 988-3757

Created Date & Time: 4/30/2020 1:05:49PM

Note: Sampler Please return this paper with your samples

Kit #: 262925

Client ID: WRD

Created By: Sophia F Liang - [SFL]
Deliver By: 05/11/2020
STG: Bottle Orders
Ice Type: G
Pre Registered

Project Code: 0250000 Bottle Orders
Group Name: WRD Pilot [Set #2]
PO#/JOB#:
Description: WRD Pilot Set #2
Shipping Method: Pickup by client

Ship Sample Kits to
GSI Environmental Inc.

# of Sample	Tests	Bottle Qty - Type [preservative information]	Total	UN DOT #
4	Total Organic Carbon	1 - 125ml amber glass [0.5 ml H2SO4 (50%)]	4	UN1830
4	@ANIONS48, Chloride, Sulfate	1 - 125ml poly [no preservative]	4	
4	Alkalinity in CaCO3 units	1 - 250ml poly [no preservative]	4	
40	@537.1	2 - 275 ml polypro w polypro cap [1.4 g Trisma]	80	
2	@537.1 TB	1 - 275 ml polypro w polypro cap [1.4g Trisma + H2O]	2	
2	@537.1 FB	1 - 275 ml polypro w polypro cap [no preservative]	2	

Sum Tests: 56 **Sum Bottles:** 96

Comments

SHIPPING:
- CLIENT P/U TUESDAY, MAY 12TH @ 1PM
- PACKAGE IN 4 COOLERS

GSI SAMPLER:
- PLEASE MAKE SURE TO RETURN THIS KIT DOCUMENT AND COC ALONG WITH THE SAMPLES.
- NITRATE/NITRITE ONLY HAS 48 HOURS HOLDING TIME SO PLEASE ENSURE SAMPLES ARRIVE BACK AT THE LAB ASAP.

ASM:
•Please also send invoices to Miae Jeon (mjeon@gsi-net.com)
•Report copies to be sent to Miae Jeon, mjeon@gsi-net.com, Pat Galvin, pegalvin@gsi-net.com, and rdtorres@gsi-net.com.

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: SA8K6

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = ~~Ce491~~ (Observation= 4.9 °C) (Corr.Factor -0.3 °C) (Final = 4.1 °C)

TYPE OF ICE: Real ✓ Synthetic _____ No Ice _____ **CONDITION OF ICE:** Frozen _____ Partially Frozen _____ Thawed _____ N/A _____

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: _____

Compliance Acceptance Criteria:

1) **Chemistry:** >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) **Microbiology, Distribution:** < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) **Microbiology, Surface Water:** < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)	2 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)
3 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)	4 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)

4 **Dioxin (1613 or 2,3,7,8 TCDD):** must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) **pH Check.** Manufacturer: _____ Lot Number: _____ pH strip type: 0 - 14 or _____ Expiration Date _____ Results: _____

6) **Chlorine check.** Manufacturer: Sansafe. Lot No.: _____ Expiration Date: _____ Results _____

7) **VOA Headspace:** **No Samples with Headspace:** ☐ **Samples with Headspace (see below):** ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Folder Comments

GAC-1-20200519 &MB-INF-20200519
Unfortunately when analyzing these two samples for EPA 537.1, the original extraction and re-extraction both had surrogate failures in the samples and batch QCs rendering the data invalid for compliance.Since there are only two bottles for each sample, we don't have any remaining back up bottles to re-extract a third time.The data will be flagged for surrogate failures.

Flags Legend:

S4 - Surrogate recovery was above laboratory and method acceptance limits. No target analytes were detected in the sample.
S7 - Surrogate recovery was below laboratory and method acceptance limits. Unable to confirm matrix effect.

The Comments Report may be blank if there are no comments for this report.

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

Folder Comments

Analytical results for Oil and Grease are submitted by Eurofins Calscience in Garden Grove, CAELAP 2944 exp 9-30-2020

Flags Legend:

BA - Target analyte detected in method blank at or above the laboratory minimum reporting limits (MRL), but analyte not present in the sample.

LM - MRL Check recovery was above laboratory acceptance limits. This target analyte was not detected in the sample.

VC - CCV is high biased, ND data are reportable as per TNI V1M4 1.7.2.e).i.

The Comments Report may be blank if there are no comments for this report.

Analytical Batch: 1251176						**Analysis Date: 05/28/2020**			
LCS1	Perchlorate		25	25.4	ug/L	101	(85-115)		

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 570-29198-1

Laboratory: Eurofins Calscience LLC

Narrative

Job Narrative
570-29198-1

Comments
No additional comments.

Receipt
The samples were received on 5/27/2020 11:47 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.2º C.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method 1664A: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 570-71847. LCS/LCSD was performed to meet QC requirement.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Detection Summary

Client: Eurofins Eaton Analytical
Project/Site: 872940

Job ID: 570-29198-1

Client Sample ID: 202005260438 — Lab Sample ID: 570-29198-1

No Detections.

Client Sample ID: 202005260448 — Lab Sample ID: 570-29198-2

No Detections.

This Detection Summary does not include radiochemical test results.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	Received project as a subcontract.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Report: 874079
Project: 0250000
Group: WRD Pilot [Set #2]

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report,
Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 870474

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = 6C8A (Observation= 10.5 °C) (Corr.Factor -0.2 °C) (Final = 10.3 °C)

TYPE OF ICE: Real ✓ Synthetic ____ No Ice ____ **CONDITION OF ICE:** Frozen ✓ Partially Frozen ____ Thawed ____ N/A ____

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: ____

Compliance Acceptance Criteria:

1) **Chemistry:** >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) **Microbiology, Distribution:** < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) **Microbiology, Surface Water:** < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	2 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)
3 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	4 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)

4 **Dioxin (1613 or 2,3,7,8 TCDD):** must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) **pH Check.** Manufacturer: ____ Lot Number: ____ pH strip type: 0 - 14 or ____ Expiration Date ____ Results: ____

6) **Chlorine check.** Manufacturer: Sansafe. Lot No.: ____ Expiration Date: ____ Results ____

7) **VOA Headspace:** No Samples with Headspace: ☐ Samples with Headspace (see below): ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Analytical Batch: 1253020						**Analysis Date: 06/04/2020**			
LCS1	Alkalinity in CaCO3 units		100	99.3	mg/L	99	(90-110)		

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Report: 875389
Project: 0250000
Group: WRD Pilot [Set #2]

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 675389

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? (Yes) / No

IR Gun ID = 6161A (Observation= 8.5 °C) (Corr.Factor -0.2 °C) (Final = 8.3 °C)

TYPE OF ICE: Real X Synthetic _____ No Ice _____ CONDITION OF ICE: Frozen X Partially Frozen _____ Thawed _____ N/A _____

METHOD OF SHIPMENT: Pick-Up / (Walk-In) / FedEx / UPS / DHL / Area Fast / Top Line / Other: _____

Compliance Acceptance Criteria:

1) **Chemistry:** >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) **Microbiology, Distribution:** < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) **Microbiology, Surface Water:** < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)	2 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)
3 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)	4 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)

4 **Dioxin (1613 or 2,3,7,8 TCDD):** must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) **pH Check.** Manufacturer: _____ Lot Number: _____ pH strip type: 0 - 14 or _____ Expiration Date _____ Results: _____

6) **Chlorine check.** Manufacturer: Sansafe. Lot No.: _____ Expiration Date: _____ Results _____

7) **VOA Headspace:** No Samples with Headspace: ☐ Samples with Headspace (see below): ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 89445

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? (Yes) / No

IR Gun ID = 616A (Observation= 13.3 °C) (Corr.Factor -0.2 °C) (Final = 13.1 °C)

TYPE OF ICE: Real X Synthetic ____ No Ice ____ CONDITION OF ICE: Frozen X Partially Frozen ____ Thawed ____ N/A ____

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: ____

Compliance Acceptance Criteria:

1) **Chemistry:** >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) **Microbiology, Distribution:** < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) **Microbiology, Surface Water:** < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	2 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)
3 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	4 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)

4 **Dioxin (1613 or 2,3,7,8 TCDD):** must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) **pH Check.** Manufacturer: ____ Lot Number: ____ pH strip type: 0 - 14 or ____ Expiration Date ____ Results: ____

6) **Chlorine check.** Manufacturer: Sansafe. Lot No.: ____ Expiration Date: ____ Results ____

7) **VOA Headspace:** No Samples with Headspace: ☐ Samples with Headspace (see below): ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

STATE CERTIFICATION LIST

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 878492

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = 6494 (Observation= 14.0 °C) (Corr.Factor -0.3 °C) (Final = 13.7 °C)

TYPE OF ICE: Real ___ Synthetic ✓ No Ice ___ CONDITION OF ICE: Frozen ✓ Partially Frozen ___ Thawed ___ N/A ___

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: ___

Compliance Acceptance Criteria:

1) Chemistry: >0, ≤ 6°C, not frozen (NELAP) (If received after 24 hrs of sample collection)

2) Microbiology, Distribution: < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) Microbiology, Surface Water: < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= ___ °C) (Corr.Factor ___ °C) (Final = ___ °C)	2 = (Observation= ___ °C) (Corr.Factor ___ °C) (Final = ___ °C)
3 = (Observation= ___ °C) (Corr.Factor ___ °C) (Final = ___ °C)	4 = (Observation= ___ °C) (Corr.Factor ___ °C) (Final = ___ °C)

4 Dioxin (1613 or 2,3,7,8 TCDD): must be between 0-4 °C, not frozen (If received after 24 hrs of sample collection)

5) pH Check. Manufacturer: ___ Lot Number: ___ pH strip type: 0 - 14 or ___ Expiration Date ___ Results: ___

6) Chlorine check. Manufacturer: Sansafe. Lot No.: ___ Expiration Date: ___ Results ___

7) VOA Headspace: No Samples with Headspace: ☐ Samples with Headspace (see below): ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

(626) 386-1100 FAX (866) 988-3757

Created Date & Time: 5/27/2020 6:04:42PM

Note: Sampler Please return this paper with your samples

Kit #: 264841

Created By: Anisha Zachariah - [ZR4B]
Deliver By: 06/08/2020
STG: Bottle Orders
Ice Type: G

Client ID: WRD
Project Code: 0250000 Bottle Orders
Group Name: WRD Pilot [Set#1]
PO#/JOB#:
Description: WRD Pilot Set #1
Shipping Method: Pickup by client

Ship Sample Kits to
GSI Environmental Inc.

Attn: Robert Torres
Phone: 951-616-8406

Send Report to

# of Sample	Tests	Bottle Qty - Type - [preservative information]	Total	UN DOT #

SHIPPING:
- CLIENT P/U TUESDAY, JUNE 9TH MORNING
- PACKAGE IN 2 LARGE COOLERS

GSI SAMPLER:
- PLEASE MAKE SURE TO RETURN THIS KIT DOCUMENT AND COC ALONG WITH THE SAMPLES.
- NITRATE/NITRITE ONLY HAS 48 HOURS HOLDING TIME SO PLEASE ENSURE SAMPLES ARRIVE BACK AT THE LAB ASAP.

ASM:
•Please also send invoices to Miae Jeon (mjeon@gsi-net.com)
•Report copies to be sent to Miae Jeon, mjeon@gsi-net.com, Pat Galvin, pegalvin@gsi-net.com, and rdtorres@gsi-net.com.

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

LCS1	Hexavalent chromium(Dissolved)		2	2.01	ug/L	101	(90-110)		
LCS2	Hexavalent chromium(Dissolved)		2	2.00	ug/L	100	(90-110)		

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Group: WRD Pilot [Set #1]

Water Replenishment District

QC Type	Analyte	Native	Spiked	Recovered	Units	Yield(%)	Limits (%)	RPD Limit(%)	RPD%
DUP_202007070505	Perfluoroundecanoic acid (PFUnA)	ND		ND	ug/L		(0-30)		
LCS3	Perfluoroundecanoic acid (PFUnA)		0.05	0.0463	ug/L	93	(70-130)		
LCS4	Perfluoroundecanoic acid (PFUnA)		0.05	0.0513	ug/L	103	(70-130)	30	10
MBLK	Perfluoroundecanoic acid (PFUnA)			<0.000667	ug/L				
MRL_CHK	Perfluoroundecanoic acid (PFUnA)		0.002	0.00203	ug/L	102	(50-150)		
MS1_202007070504	Perfluoroundecanoic acid (PFUnA)	ND	0.025	0.0245	ug/L	98	(70-130)		

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	Received project as a subcontract.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	Preservation labels on samples match COC
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

2	@537.1 TB	1 - 275 ml polypro w polypro cap [1.4g Trisma + H2O]	2	
2	@537.1 FB	1 - 275 ml polypro w polypro cap [no preservative]	2	

Sum Tests: 56 **Sum Bottles:** 96

Comments

SHIPPING:
- CLIENT P/U TUESDAY, JULY 7TH MORNING
- PACKAGE IN 4 x 32 QT COOLERS

GSI SAMPLER:
- PLEASE MAKE SURE TO RETURN THIS KIT DOCUMENT AND COC ALONG WITH THE SAMPLES.
- NITRATE/NITRITE ONLY HAS 48 HOURS HOLDING TIME SO PLEASE ENSURE SAMPLES ARRIVE BACK AT THE LAB ASAP.

ASM:
•Please also send invoices to Miae Jeon (mjeon@gsi-net.com)
•Report copies to be sent to Miae Jeon, mjeon@gsi-net.com, Pat Galvin, pegalvin@gsi-net.com, and rdtorres@gsi-net.com.

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 881682

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = 6491 (Observation= 7.5 °C) (Corr.Factor -0.3 °C) (Final = 7.2 °C)

TYPE OF ICE: Real ✓ Synthetic ____ No Ice ____ CONDITION OF ICE: Frozen ✓ Partially Frozen ____ Thawed ____ N/A ____

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: ____

Compliance Acceptance Criteria:

1) Chemistry: >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) Microbiology, Distribution: < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) Microbiology, Surface Water: < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	2 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)
3 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	4 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)

4 Dioxin (1613 or 2,3,7,8 TCDD): must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) pH Check. Manufacturer: ____ Lot Number: ____ pH strip type: 0 - 14 or ____ Expiration Date ____ Results: ____

6) Chlorine check. Manufacturer: Sansafe. Lot No.: ____ Expiration Date: ____ Results ____

7) VOA Headspace: No Samples with Headspace: ☐ Samples with Headspace (see below): ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

			SM 2320B - Alkalinity in CaCO3 units						
	07/20/20 20:26		1262820	(SM 2320B)	Alkalinity in CaCO3 units	170	mg/L	2.0	1

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Report: 883523
Project: 0250000
Group: WRD Pilot [Set #2]

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 886525

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = 630A (Observation= 19.3 °C) (Corr.Factor -0.2 °C) (Final = 19.1 °C)

TYPE OF ICE: Real X Synthetic _____ No Ice _____ **CONDITION OF ICE:** Frozen X Partially Frozen _____ Thawed _____ N/A ____

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: _____

Compliance Acceptance Criteria:

1) **Chemistry:** >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) **Microbiology, Distribution:** < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) **Microbiology, Surface Water:** < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	2 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)
3 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	4 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)

4 **Dioxin (1613 or 2,3,7,8 TCDD):** must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) **pH Check.** Manufacturer: _____ Lot Number: _____ pH strip type: 0 - 14 or _____ Expiration Date _____ Results: _____

6) **Chlorine check.** Manufacturer: Sansafe. Lot No.: _____ Expiration Date: _____ Results _____

7) **VOA Headspace:** **No Samples with Headspace:** ☐ **Samples with Headspace (see below):** ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Report: 884399
Project: 0250000
Group: WRD Pilot [Set #1]

SFL: Sophia F Liang
Project Manager

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

IR Gun ID = 630B (Observation= 1.9 °C) (Corr.Factor 6.2 °C) (Final = 1.7 °C)

TYPE OF ICE: Real ✓ Synthetic ____ No Ice ____ CONDITION OF ICE: Frozen ____ Partially Frozen ____ Thawed ____ N/A ____

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: ____

Compliance Acceptance Criteria:

1) Chemistry: >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) Microbiology, Distribution: < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) Microbiology, Surface Water: < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	2 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)
3 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)	4 = (Observation= ____ °C) (Corr.Factor ____ °C) (Final = ____ °C)

4 Dioxin (1613 or 2,3,7,8 TCDD): must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) pH Check. Manufacturer: ____ Lot Number: ____ pH strip type: 0 - 14 or ____ Expiration Date ____ Results: ____

6) Chlorine check. Manufacturer: Sansafe. Lot No.: ____ Expiration Date: ____ Results ____

7) VOA Headspace: No Samples with Headspace: ☐ Samples with Headspace (see below): ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Samp ID	Bottle #	None/<6 mm	>6mm

Samp ID	Bottle #	None/<6 mm	>6mm

Samp ID	Bottle #	None/<6 mm	>6mm

Samp ID	Bottle #	None/<6 mm	>6mm

Note Sample IDs which have dissimilar headspace (i.e. potential sampling errors): ____

Lakewood, CA 90712

Flags Legend:

LK - The associated blank spike recovery was above method acceptance limits. This target analyte was not detected in the sample.

LM - MRL Check recovery was above laboratory acceptance limits. This target analyte was not detected in the sample.

R2 - RPD/RSD exceeded the laboratory acceptance limit. See case narrative.

The Comments Report may be blank if there are no comments for this report.

Rounding on totals after summation.
(c) - indicates calculated results. Analysis is a calculated result. Reported results are not rounded until the final step before reporting. Therefore methods that use a test result with further calculation may have slight differences in final result than the component analyses.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Spike recovery is already corrected for native results.
Spikes which exceed Limits and Method Blanks with positive results are highlighted by Underlining.
Criteria for MS and Dup are advisory only, batch control is based on LCS. Criteria for duplicates are advisory only, unless otherwise specified in the method.
RPD not calculated for LCS2 when different a concentration than LCS1 is used.
RPD not calculated for Duplicates when the result is not five times the MRL (Minimum Reporting Level).
(S) - Indicates surrogate compound.
(I) - Indicates internal standard compound.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	Received project as a subcontract.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	Preservation labels on samples match COC
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Group: WRD Pilot [Set #2]

* Accredited in accordance with TNI 2016 and ISO/IEC 17025:2017.
* Laboratory certifies that the test results meet all **TNI 2016 and ISO/IEC 17025:2017** requirements unless noted under the individual analysis.
* Following the cover page are State Certification List, ISO 17025 Accredited Method List, Acknowledgement of Samples Received, Comments, Hits Report, Data Report, QC Summary, QC Report and Regulatory Forms, as applicable.
* Test results relate only to the sample(s) tested.
* Test results apply to the sample(s) as received, unless otherwise noted in the comments report (ISO/IEC 17025:2017).
* This report shall not be reproduced except in full, without the written approval of the laboratory.
* This report includes ISO/IEC 17025 and non-ISO 17025 accredited methods.

INTERNAL CHAIN OF CUSTODY RECORD

EEA Folder Number: 88569U

SAMPLE TEMP RECEIVED:

Note: If samples are out of temperature range, let the ASMs know. ASMs will determine whether to proceed with analysis or not.

SAMPLES REC'D DAY OF COLLECTION? Yes / No

IR Gun ID = 630A (Observation= 10.4 °C) (Corr.Factor 0.2 °C) (Final = 10.2 °C)

TYPE OF ICE: Real ✓ Synthetic _____ No Ice _____ **CONDITION OF ICE:** Frozen ✓ Partially Frozen _____ Thawed _____ N/A _____

METHOD OF SHIPMENT: Pick-Up / Walk-In / FedEx / UPS / DHL / Area Fast / Top Line / Other: _____

Compliance Acceptance Criteria:

1) **Chemistry:** >0, ≤ 6°C, not frozen (NELAP) (if received after 24 hrs of sample collection)

2) **Microbiology, Distribution:** < 10°C, not frozen (can be ≥10°C if received on ice the same day as sample collection, within 8 hours)

3) **Microbiology, Surface Water:** < 10°C (if received after 2 hours of sample collection)

If out of temperature range for both Chemistry and Microbiology samples and temperature does not confirm, then measure the temperature of each quadrant and record each temperature of the quadrants

1 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)	2 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)
3 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)	4 = (Observation= _____ °C) (Corr.Factor _____ °C) (Final = _____ °C)

4 **Dioxin (1613 or 2,3,7,8 TCDD):** must be between 0-4 °C, not frozen (if received after 24 hrs of sample collection)

5) **pH Check.** Manufacturer: _____ Lot Number: _____ pH strip type: 0 - 14 or _____ Expiration Date _____ Results: _____

6) **Chlorine check.** Manufacturer: Sansafe. Lot No.: _____ Expiration Date: _____ Results _____

7) **VOA Headspace:** **No Samples with Headspace:** ☐ **Samples with Headspace (see below):** ☐

Headspace Documentation (use additional VOC Internal COFC for additional bottles)

Exempt from headspace concerns: Methods 515.4, HAA(6251,552), 505, SPME, @CH, 532LCMS, 556, 536, Anatoxin, LCMS methods using 40 ml vials, International clients:

Samp ID	Bottle #	None/<6 mm	>6mm

Samp ID	Bottle #	None/<6 mm	>6mm

Samp ID	Bottle #	None/<6 mm	>6mm

Samp ID	Bottle #	None/<6 mm	>6mm

Note Sample IDs which have dissimilar headspace (i.e. potential sampling errors): _____
